"Venting" is accomplished by opening the vent port to-tank through suitable external valving.

This valve can be remotely controlled by connecting the inlet of another relief valve to the vent port of the valve* (through suitable external orificing for stability). The pressure setting at which the main poppet opens can be adjusted at the remote relief valve, providing it is set to a lower value than the internal setting.

The tank connection should be piped directly to tank to minimize back pressure. Any pressure in the tank line is additive to the pressure setting.

*Recommended orifice size is .040".

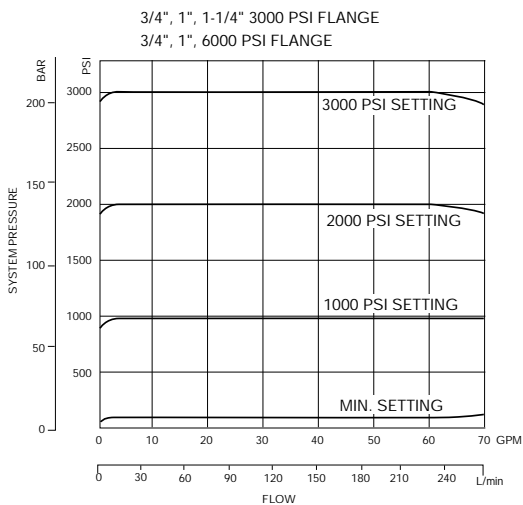

Performance characteristics

$v = 35 \text{ mm}^2/\text{s}$

Nominal override characteristics
