

Spindle First: Tightening spindles for ring exchange – Maintenance without downtime

Regular inspection and maintenance of tightening spindles without expensive downtimes: the new Spindle First service concept allows you to combine sustained process reliability with the highest levels of availability. We will take care of the maintenance of your spindles and, on request, can take over the replacement on-site. Your benefits: maximum system availability and reliably tightening quality.

Regular maintenance and machine capability test

Safety-related screw fittings have specific requirements. As certificated service partner we recommend a machine capability test every year or every one million cycles and a biannual spindle maintenance. The tightening spindle must be removed and dismantled for this purpose, but Rexroth offers you a unique service concept, enabling you to meet these specifications with short downtimes and minimum time and effort.

Replacement without downtime

Simply make use of the ring exchange from our new service range Spindle First. If a spindle is due to be examined, we will send you an identical and maintained tightening spindle with a 12-months guarantee. You then replace the old spindle with the one provided. In most cases, you will incur no downtime, as short breaks in production are sufficient for replacement. On request, we can handle the replacement on-site. Afterwards, production can begin again im-

mediately and documented. We can find a solution fitting for you even if you have tightening spindles with special components in the application.

Minimum time and effort

We will inform you early on about useful maintenance measures and take care of all logistics. We will overhaul your old tightening spindle in our certified workshops.

Your benefits

- ▶ Maximum availability
- ▶ Reduced downtimes
- ▶ Reliable, recordable tightening processes
- ▶ Minimum time and effort
