

Minimize the risk of failure: Retrofit kits for Indramat RAC drives

The drives in the Indramat RAC series have been delivering service-proven operation for more than twenty years now, but the risk of failure is now increasing. That is why Rexroth Service is offering quick and economical solutions in the form of the retrofit program RAC. This will enable you to ensure the continued availability of your plant, minimize the risk of failure and retain unrestricted access to servicing based on manufacturer's specifications.

Standard retrofit kits

Simply let Rexroth Service know the type key for your RAC drive, along with the other Bosch and Indramat products installed in your machine or plant. For 90 percent of all application scenarios we have defined standard retrofit kits based on the latest IndraDrive series. Your benefits: minimal expense, short delivery times, and the latest new hardware and software.

Special solutions quickly configured

Just one in ten installed drives varies from the standard. In these cases the Rexroth service specialists analyze your RAC drives on-site and quickly configure a custom-tailored solution.

Flexibility in case of necessity

Even if a failure occurs, you have the freedom to choose: We recommend a retrofit kit on the basis of the latest IndraDrive series in order to keep your automation running for a longer period of time. If you only need your automation for a short while longer, we would be pleased to give you individualized advice.

Act now

Send us your RAC data immediately via hotline 24/7. You will be surprised how quick and cost effective you can improve your machine availability.

Your benefits

- ▶ Maximum system availability by the latest drive technology
- ▶ Seamless changeover to a functionally compatible successor solution by definition of standard retrofit kits
- ▶ Rexroth as your partner for all your service questions on a comprehensive range of services
