

Directional high-response cartridge valve, pilot-operated, with hydraulic actuation and inductive position transducer

Type 3WRCBH

- ▶ Size 25, 32, and 50
- ▶ Component series 1X
- ▶ Maximum operating pressure 315 bar
- ▶ Maximum flow 2250 l/min

Features

- ▶ 3-way cartridge valve
- ▶ Control spool with anti-rotation feature and control edges in servo quality
- ▶ Pressure-resistant up to 315 bar
- ▶ Control line A of the pilot control valve according to X generally required
- ▶ Dynamic reset "Z" (B to Z) possible for version "F" (only NG25 and 50)
- ▶ Inductive position transducer, position-controlled by external pilot control valve and valve electronics
- ▶ Pilot control valve at the manifold externally assigned
- ▶ Hysteresis < 0.1%, hardly measurable
- ▶ Flow characteristic, progressive with fine control edge

Function, section

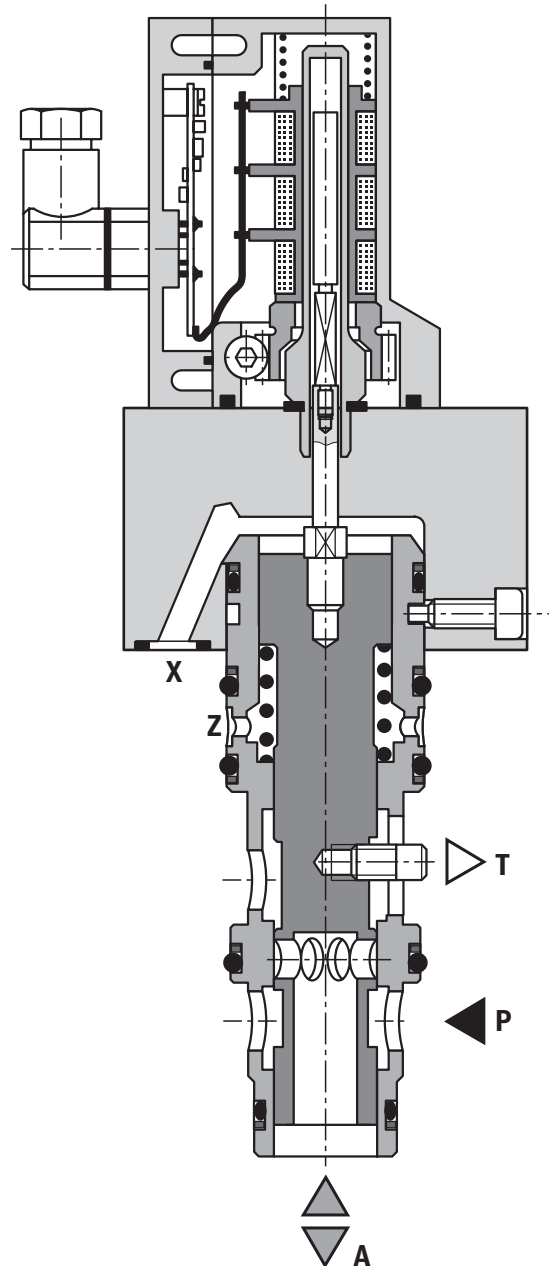

In connection with pilot control valves, valves of type 3WRCBH are pilot-operated directional high-response cartridge valves with 2 control edges in servo quality, P–A / A–T. They control size and direction of a flow. The transition was designed by means of fine control edges for minimum leakage at high and linear pressure amplification. The control spool position is deflected by the pilot oil of the pilot control valve. In case X is unloaded and/or in case of power failure, the load pressure in A and the internal spring result in a control spool reset (A–T). The control spool position is recorded by an inductive position transducer. Its signal and the valve electronics allow for position control via a pilot control valve. An additional pilot oil port Z (only version "F" and NG25 and 50) allows for fast reset in case of low load in port A. In this connection, the pilot control valve must be connected to A–X and B–Z.

For the external position control, the following components are required:

- ▶ Pilot control valve type 4WRP(E)H 6 (separate order, see page 15)
- ▶ Integrated electronics (OBE) or external control electronics (separate order, see page 15)
- ▶ Valve block (customer side).

The pilot oil guidance in the valve block and the electrical connection design the pilot-operated valve function for control tasks in the system. In most cases, this is a process for velocity and pressure control. The process controllers of the system generate the valve signal for the control loop.

General				
Size	NG	25	32	50
Installation position	Horizontal or position transducer downwards			
Ambient temperature range	°C	-20 ... +50		
Mass	kg	3.9	5.6	14.7
Vibration resistance, test condition	max. 25 g, room vibration test in all directions (24h)			

Hydraulic						
Maximum operating pressure ▶ Port P, A, T, X, Z		bar	315			
Minimum pilot pressure		bar	$p_A + 4$			
Rated flow ($\Delta p = 5$ bar/control edge) ¹⁾		l/min	65	190	380	300 750
Maximum flow		l/min	350	570	820	1600
Pilot flow ²⁾		l/min	8		16	28
Leakage flow (at 100 bar)	▶ Pilot control valve	cm ³ /min	<300		<500	<900
	▶ Main stage	cm ³ /min	<350	<350	<500	<500 <600
Hydraulic fluid		see table page 6				
Hydraulic fluid temperature range		°C	-20 ... +80			
Viscosity range	▶ Recommended	mm ² /s	20 ... 100			
	▶ Maximum admissible	mm ² /s	10 ... 800			
Maximum admissible degree of contamination of the hydraulic fluid; cleanliness class according to ISO 4406 (c)		Class 18/16/13 ³⁾				
Pilot control valve	▶ Type 4WRPH 6	see page 15				
	▶ Type 4WRPEH 6	see page 15				

Static/dynamic				
Size	NG	25	32	50
Manufacturing tolerance q_{Vmax}	%	≤10		
Actuating time ⁴⁾ ▶ A-X ▶ A-X; B-Z	ms	33	28	60
	ms	27	–	50
Switch-off behavior (after electrical shut-off)		Pilot control valve in "fail-safe" position, main valve moves to position A-T		
Temperature drift (ΔT = 40 °C)	%	Zero shift < 1		
Zero compensation		Valve amplifier ±5% adjustable, pilot control valve with integrated electronics (OBE) set in the plant		

¹⁾ Flow for deviating Δp (control edge):

$$q_x = q_{Vnom} \cdot \sqrt{\frac{\Delta p_x}{5}}$$

**Notice:**

Information on rated flow/maximum flow only in case of compliance with the installation dimensions.

²⁾ $p = 100$ bar; maximum dynamics

³⁾ The cleanliness classes specified for the components must be adhered to in hydraulic systems. Effective filtration prevents faults and simultaneously increases the life cycle of the components. Available filters can be found at www.boschrexroth.com/filter.

⁴⁾ Signal step 0 ... 100% at $p_x = 100$ bar / $p_A = 50$ bar

**Important information on hydraulic fluids:**

- For further information and data on the use of other hydraulic fluids, please refer to the data sheets above or contact us.
- There may be limitations regarding the technical valve data (temperature, pressure range, life cycle, maintenance intervals, etc.).
- The ignition temperature of the hydraulic fluid used must be 50 K higher than the maximum surface temperature.
- **Bio-degradable and flame-resistant – containing water:** If components with galvanic zinc coating (e.g. version "J3" or "J5") or parts containing zinc are used, small amounts of dissolved zinc may get into the hydraulic system and cause accelerated aging of the hydraulic fluid. Zinc soap may form as a chemical reaction product, which may clog filters, nozzles and solenoid valves – particularly in connection with local heat input.

► Flame-resistant – containing water:

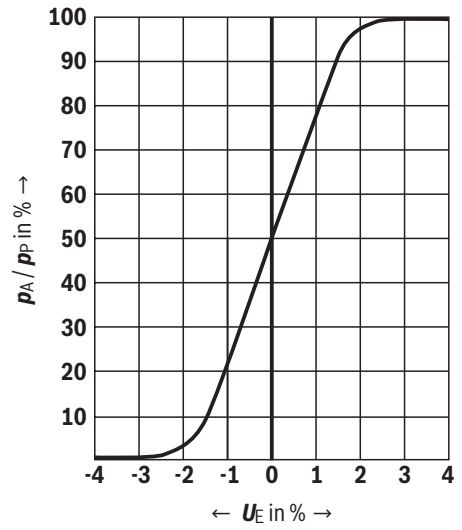

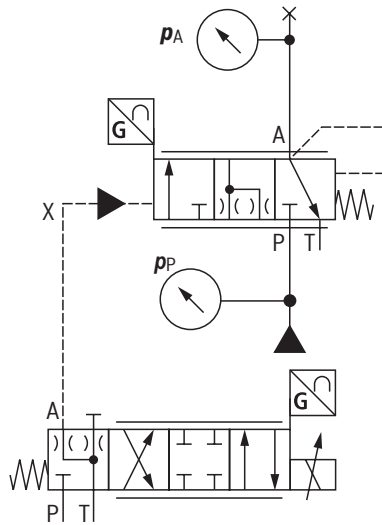

- Due to the increased cavitation tendency with HFC hydraulic fluids, the life cycle of the component may be reduced by up to 30% as compared to the use with mineral oil HLP. In order to reduce the cavitation effect, it is recommended – if possible specific to the installation – backing up the return flow pressure in ports T to approx. 20% of the pressure differential at the component.
- Dependent on the hydraulic fluid used, the maximum environment and hydraulic fluid temperature must not exceed 50 °C. In order to reduce the heat input into the component, the command value profile is to be adjusted for proportional and high-response valves.
