

# Compact modules CKK/CKR

**Identification system for short product names**

Compact modules are identified by the type designation and size.

<b>Example</b>		<b>C</b>	<b>K</b>	<b>K</b>	<b>- 110 -</b>	<b>NN</b>	<b>- 1</b>
<b>System</b>	=	Compact module ( <b>C</b> )					
<b>Guideway</b>	=	Ball rail system ( <b>K</b> )					
<b>Drive</b>	=	Ball screw assembly ( <b>K</b> ) Toothed belt drive ( <b>R</b> )					
<b>Size</b>	=	070 / 090 / <b>110</b> / 145 / 200 / 280					
<b>Version</b>	=	Standard version ( <b>N</b> )					
<b>Generation</b>	=	Product generation <b>1</b>					

**Changes/additions at a glance**

- ▶ MS2N motors revised: chapter "Configuration and ordering" and chapter "Motors"
- ▶ New sizes CKK-280, CKR-280 added
- ▶ "Automation package" revised

**Product information**

- ▶ Screw support (SPU) for CKK-280 available from approx. Q2 2025

## Product description

### Characteristic features

- ▶ Six fine-tuned sizes based on a compact precision aluminum profile with two integrated preloaded ball rail systems
- ▶ Identical external dimensions between compact module types CKK and CKR.
- ▶ Four different lube versions (see the following pages and the chapter "Lubrication")
- ▶ Ready-to-install compact modules in any length up to  $L_{max}$
- ▶ Aluminum carriages available in different versions depending on load

### Further highlights

- ▶ Flexible thanks to options
- ▶ Ready-to-install with various attachment parts
- ▶ Centering holes for simple combination with other linear motion systems and connection elements
- ▶ Economical maintenance thanks to one-point lubrication feature (grease lubrication) from both sides or via the carriage or via a connection plate

**Compact modules CKK**

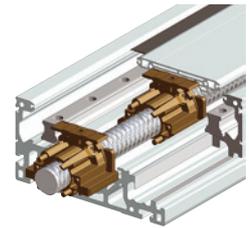

**Compact modules CKR**

Compact modules are available as complete solutions with motor, controller, and control system. For more information, see the "Axis / drive / software" chapter.

**Compact modules CKK****with ball rail system and ball screw assembly**

- ▶ Drive via precision ball screw assembly
- ▶ Screw support for the realization of high speeds on long assembly lengths for CKK-200/-280
- ▶ Protection of installation elements through a cover plate and two cover strips; Optionally increased protection thanks to "Resist" cover
- ▶ Repeatability of up to  $\pm 0.005$  mm

**"Resist" cover****Connection plates****Screw support SPU for CKK-200/-280****Compact modules CKR****with ball rail system and toothed belt drive**

- ▶ Realization of greater lengths of up to 10,000 mm
- ▶ Preloaded toothed belt
- ▶ Intelligent toothed belt guide protects inner components
- ▶ Repeatability of up to  $\pm 0.05$  mm

**Connection plates**

Axis / drive / software

**SIMPLY SAVE TIME AND MONEY:  
EVERYTHING FROM A SINGLE SOURCE.  
WITH A SINGLE MATERIAL NUMBER.**

So that you can realize fully automated movements with single axes faster, all components are now available in one package.

With just a few clicks, you can design and configure motor, drive controller, mains filter and cable online.

Ordered with just one material number, your solution will be available to you in now time – and immediately ready for operation thanks to the axis parameters stored in the motor. If necessary, the proven Rexroth service is always available to assist you.

Really everything from a single source.  
Can it be easier?

# Faster automation:

# single axis + drive + software in one package.

**2 ORDERING OPTIONS,  
ALL FREEDOMS:**

- 1. Single axis**
- 2. Single axis + drive**  
(incl. mains filter/cable)

► For further information see chapter "Configuration and ordering" and chapter "Automation package".

## Mehrachssysteme/Smart Function Kits

### Multi-axis systems

Further information on  
multi-axis systems

## Product overview

**LINEAR MOTION TECHNOLOGY  
ONE GENERATION AHEAD:  
COMPLETE SOLUTION - MINIMAL ENGINEERING:**

The Factory of the Future will be more profitable, sustainable and future-proof – despite increasingly individual and flexible production processes. The requirements are therefore defined. As a leading supplier of linear motion technology and mechatronic systems, Bosch Rexroth is already providing the answers today: with quick click product selection, simple configuration & ordering processes, and intuitive commissioning of complete solutions without any programming knowledge. This ensures an extremely short time-to-market and high productivity during operation, even for today's highly complex Today.

# Factory of the future

**Now. Next. Beyond.**

**NEARLY UNLIMITED  
FIELDS OF APPLICATION  
FOR MULTI-AXIS SYSTEMS**

Pick & place

Positioning

Palletizing

Feeding

Mov

**New standard for  
ready-to-install sub-systems:  
easier to select and configure,  
faster to install and get started**

**MULTI-AXIS SYSTEMS MADE EASY.  
EVERYTHING FROM A SINGLE SOURCE**

Bosch Rexroth now makes the path to a ready-to-install sub-system unbeatably simple. More than 30 years of linear axis expertise have gone into the new multi-axis modular system and the completely revised LinSelect selection tool. There is no easier or faster way to select, configure and commission Cartesian multi-axis systems from standardized best-in-class components. You'll benefit from the latest generation of multi-axis systems from Bosch Rexroth: You'll receive ready-to-install, scalable positioning, handling and dispensing solutions made of proven and perfectly matched components, including all attachments, cable systems, motors and drive controllers – all from a single source, all from one company.

And if your fully assembled, fully integrable sub-system needs to be able to do even more, then take a look at the next step: Smart MechatroniX (see Smart Function Kits chapter) expands the components to include sensors, electronics and software – with completely new solution approaches and business models.

**WE MOVE. YOU WIN.**

# Lubrication versions

Two drive versions:

- ▶ Compact modules CKK with ball rail system and ball screw assembly
- ▶ Compact modules CKR with ball rail system and toothed belt drive

Four different lube versions (depending on size)

- ▶ Standard lubrication (LSS)
- ▶ Preserved (LPG)
- ▶ Carriage with connection plate prepared for connection to central lubrication systems for liquid grease (LCF)
- ▶ Carriage with connection plate prepared for connection to central lubrication systems for oil (LCO)

Versions for oil and liquid grease lubrication prepared for connection to central lubrication systems

- ▶ High operational reliability through automated relubrication
- ▶ Need-based maintenance reduces consumption of lubricant, while ensuring high availability
- ▶ More degrees of freedom as lubrication is not dependent on position and installation location
- ▶ Low-cost unmanned maintenance

## **Notes:**

### **LSS:**

- ▶ Initial lubrication by Bosch Rexroth
- ▶ Relubrication using manual grease gun

### **LPG:**

- ▶ Ball rail system and ball screw assembly only with corrosion prevention
- ▶ Relubrication using manual grease gun
- ▶ Basic lubrication required

### **LCF:**

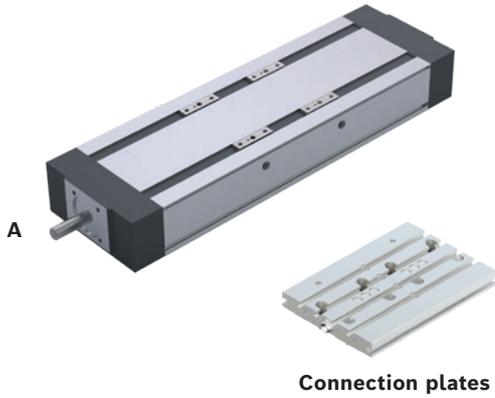

- ▶ Prepared for connection to central lubrication systems for liquid grease (grade NLGI 00 in accordance with DIN 51818)
- ▶ Lubrication with liquid grease only via single-line piston distributor system
- ▶ Basic lubrication required

### **LCO:**

- ▶ Prepared for connection to central lubrication systems for oil
- ▶ Oil lubrication only via single-line piston distributor system
- ▶ Runner block and ball screw assembly nut with integrated non-return valves
- ▶ Basic lubrication required

**Compact modules CKK**  
**Lubrication version LSS, LPG**

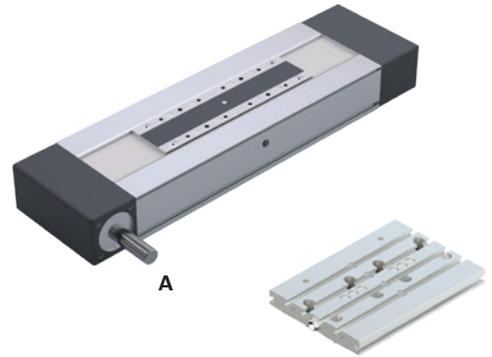

- ▶ Grease lubrication with manual grease gun via frame, carriage or via connection plate

**Connection plates**

**Compact modules CKR**  
**Lubrication version LSS, LPG**

- ▶ Grease lubrication with manual grease gun via frame, carriage or via connection plate

**Connection plates**

**Lubrication version LCF, LCO**

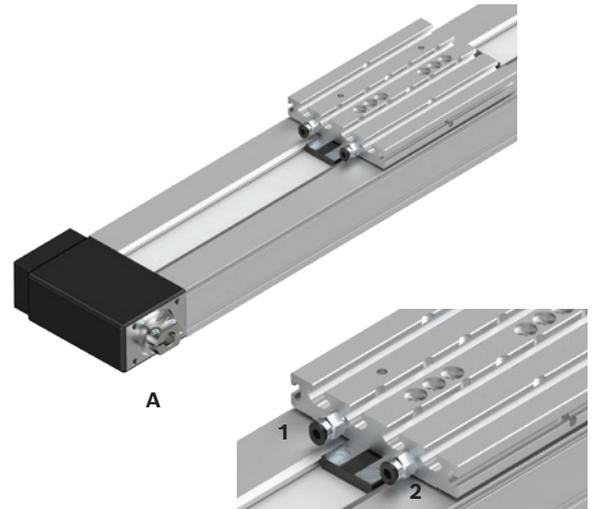

- ▶ 3 lube fittings
- ▶ Prepared for connection to central lubrication systems

- A** Drive side
- 1** Lube connection, runner block left
- 2** Lube connection, runner block right
- 3** Lube connection, ball screw assembly

**Lubrication version LCF, LCO**

- ▶ 2 lube fittings
- ▶ Prepared for connection to central lubrication systems

- A** Drive side
- 1** Lube connection, runner block left
- 2** Lube connection, runner block right

## Form of delivery

Compact modules with ball rail system and ball screw or toothed belt drive are delivered completely assembled.

### **Motor attachment**

If a combination of motor and motor attachment has been selected, then the components are attached as shown in the figure, which also shows the location of the motor connector.

When ordering motor attachments without motor, not all parts can be mounted.

Final assembly must then be carried out by the customer.

All necessary instructions and parameters for professional assembly are included.

### **Available options**

Cable duct, mounting duct, switch, switching cam and socket with connector are included as loose parts.

### **Lubrication**

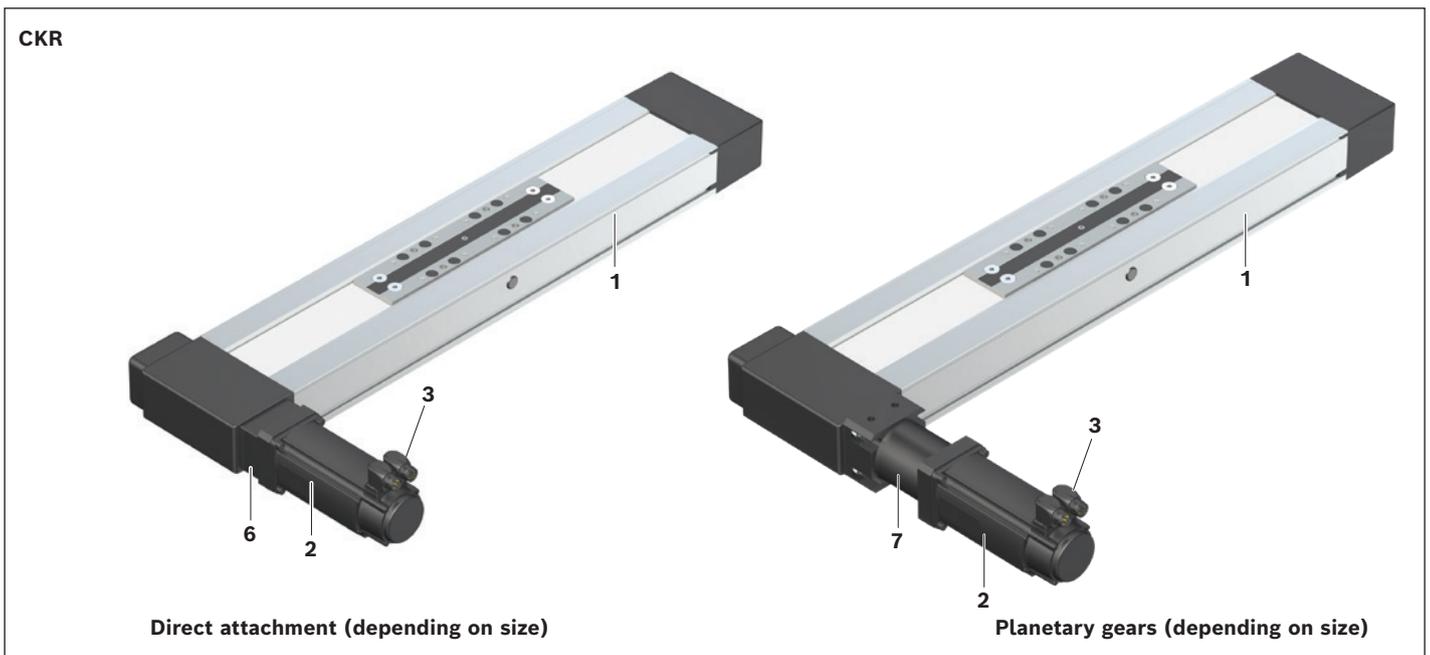

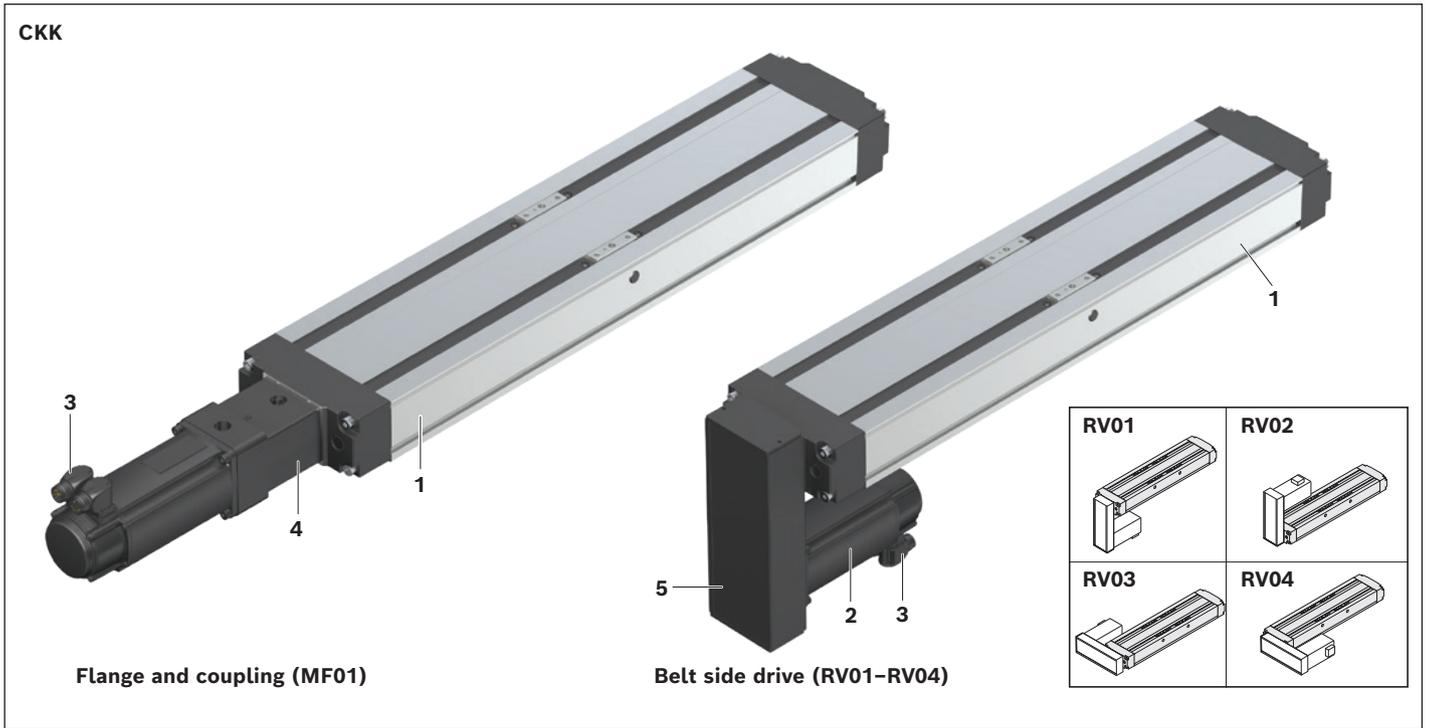

Compact modules are delivered with initial greasing, depending on the lubricant used.

For more information on lubricants, see Chapter "Lubrication".

Documentation

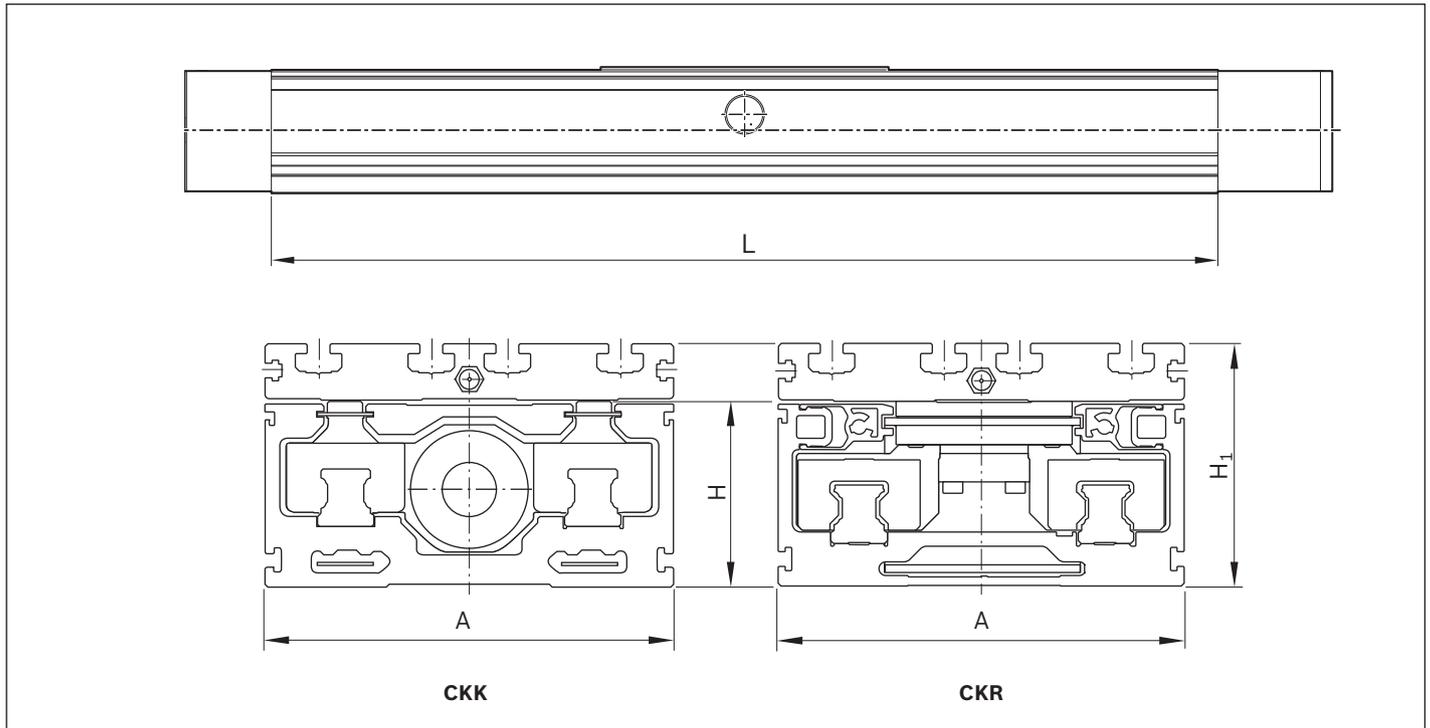

Each compact module is supplied with the accompanying documentation.

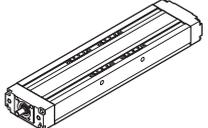

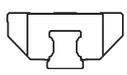

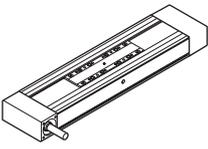

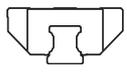

All CKK and CKR versions that have been configured with "Carriage with connection plate" are supplied without the lube ports in the frame. All configured compact modules with carriages without connection plate are still supplied with lube ports in the frame.

- 1** Linear motion system
- 2** Motor
- 3** Motor connector
- 4** Flange and coupling
- 5** Belt side drive
- 6** Direct attachment (flange)
- 7** Gearing

# Overview of types with load capacities

Compact modules	Type	Guideway	Drive
	CKK	 Ball rail system	 Ball screw assembly
	CKR	 Ball rail system	 Toothed belt drive

**Note on dynamic load capacities and moments**

Determination of the dynamic load capacities and moments is based on a total travel of 100,000 m.

Often only 50,000 m of total travel are actually stipulated.

For comparison: Multiply values  $C$ ,  $M_t$  and  $M_L$  by a factor of 1.26.

<b>L<sub>max</sub></b> (mm)	1,500			5,500			5,500			5,500			10,000			5,500		
<b>Dynamic load capacity C<sub>gw</sub><sup>2)</sup></b> (N)	3,830			7,505			32,035			76,025			121,185			216,700		

<sup>1)</sup> Up to 5,500 mm are possible with screw support (SPU).

<sup>2)</sup> The maximum permitted dynamic values are specified here. They vary depending on the carriage length.

# Compact modules with ball screw assembly (CKK)

## Product overview

### Features

- ▶ Six fine-tuned sizes based on a compact precision aluminum profile with two integrated preloaded ball rail systems
- ▶ Four different lube versions
- ▶ Ready-to-install compact modules in any length up to  $L_{max}$
- ▶ Driven by precision ball screw assembly in rolled design tolerance grade T7 in accordance with DIN 69051 with single nut set to zero-clearance
- ▶ High travel speeds thanks to large leads with high precision over long lengths
- ▶ Aluminum carriages available in different lengths
- ▶ Protection of installation elements through a cover plate and two cover strips; optionally increased protection thanks to "Resist" cover
- ▶ Low-cost maintenance
- ▶ Repeatability of up to  $\pm 0.005$  mm

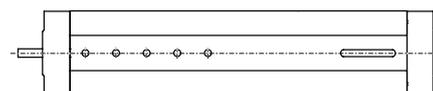

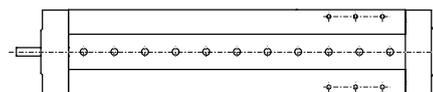

### Further highlights

- ▶ Flexible thanks to selectable options
- ▶ Centering holes for simple combination with other linear motion systems and connection elements
- ▶ Extensive accessories for connection and clamping units
- ▶ Nameplate with parameters for easy commissioning

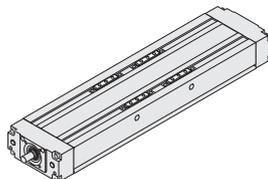

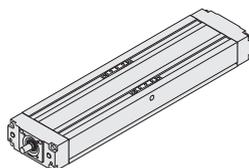

### Attachments

- ▶ Motor attachments with flange and coupling or via a belt side drive
- ▶ Motor attachment kits according to customer specification
- ▶ Maintenance-free servo motors with selectable brake and attached feedback
- ▶ Magnetic sensors, switch activation without additional switching cam
- ▶ Socket and connector
- ▶ Cable duct made of aluminum for sensors

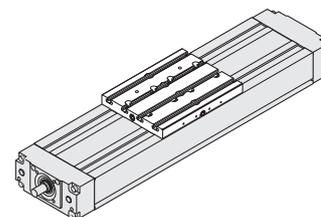

### Design/options for guideway (frame), carriages, connection plates

Guideway (frame)

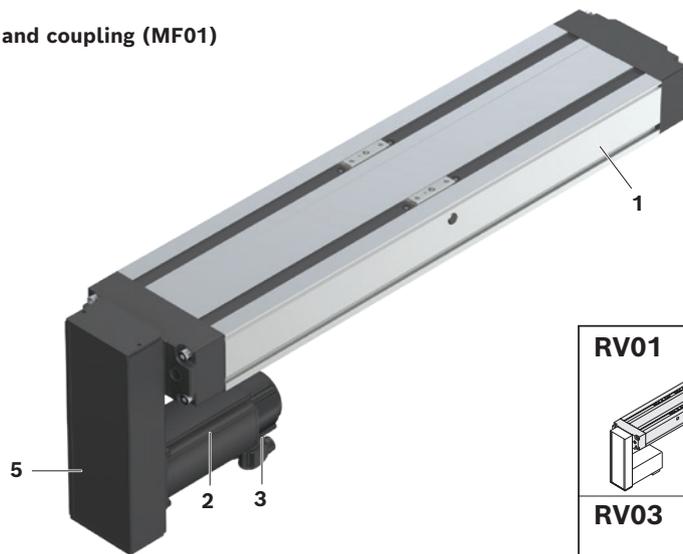

Carriages

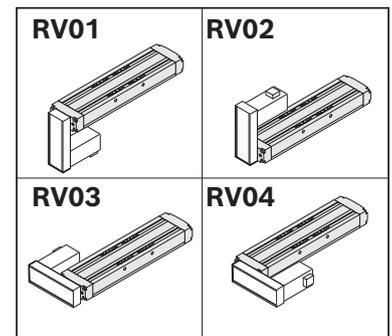

Connection plates

**Flange and coupling (MF01)**

**Belt side drive (RV01-RV04)**

- 1 Linear motion system
- 2 Motor
- 3 Motor connector
- 4 Flange and coupling
- 5 Belt side drive

**Screw support for compact module CKK-200/-280**

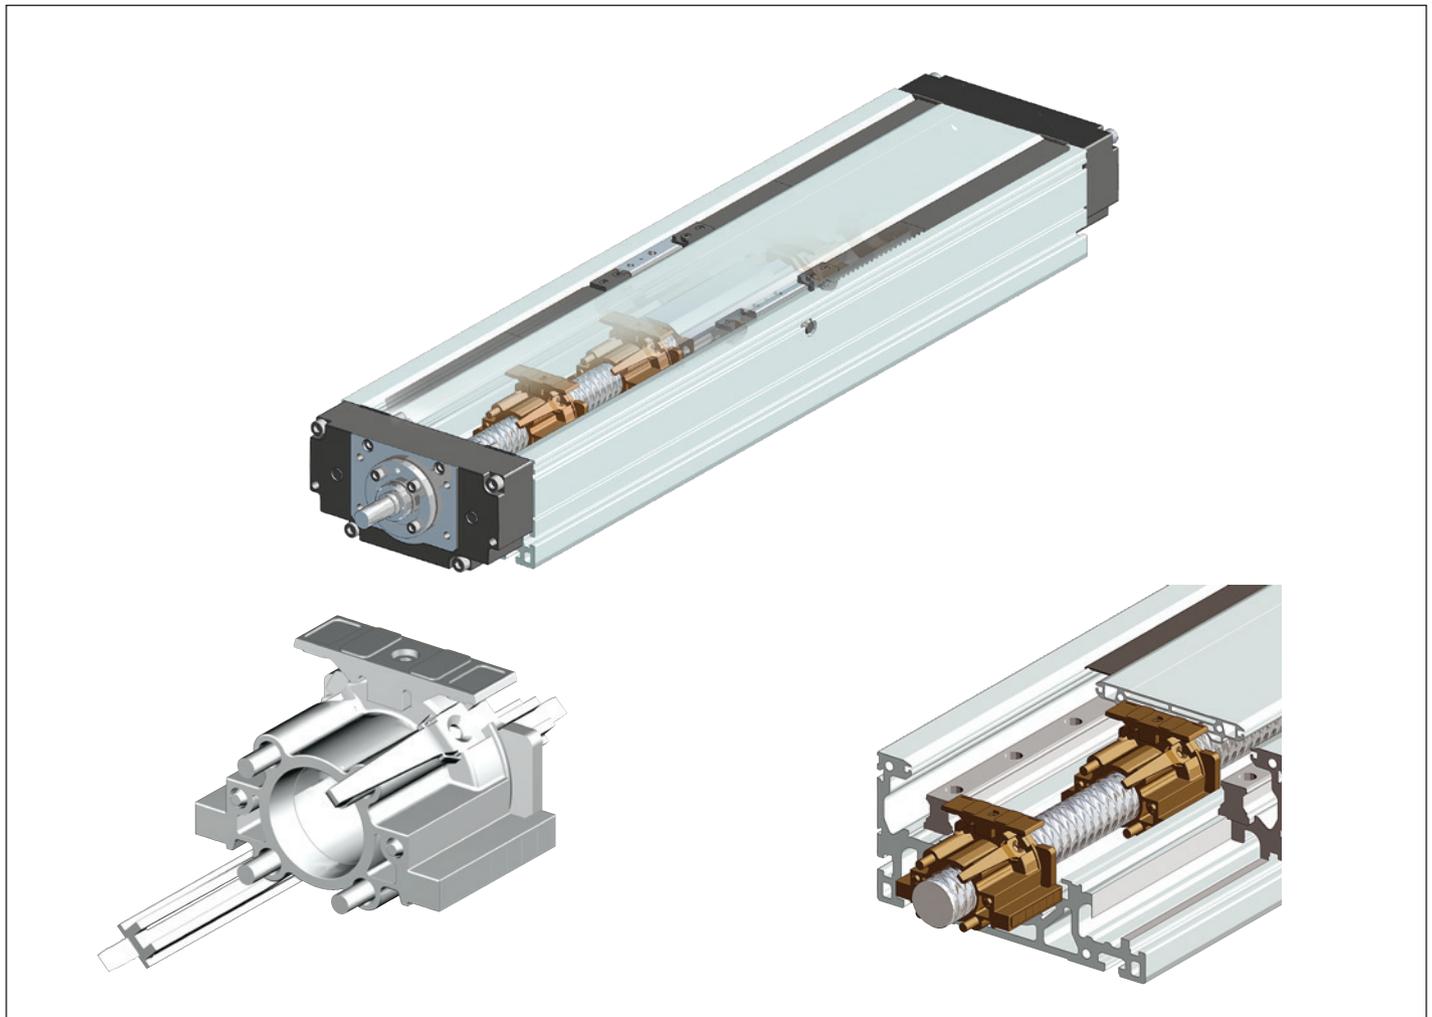

**Structural design:**

- ▶ Guidance of the screw supports in the frame.

**Features:**

- ▶ High speed over longer lengths of up to 5,500 mm.
- ▶ Elastomer buffer provides cushioning between carriage and screw supports.
- ▶ Screw supports are maintenance-free.
- ▶ Screw supports are protected by the cover plate and two cover strips.
- ▶ The screw supports prevent the cover plate from sagging in all directions.

 **Screw support suitable for horizontal operation only**

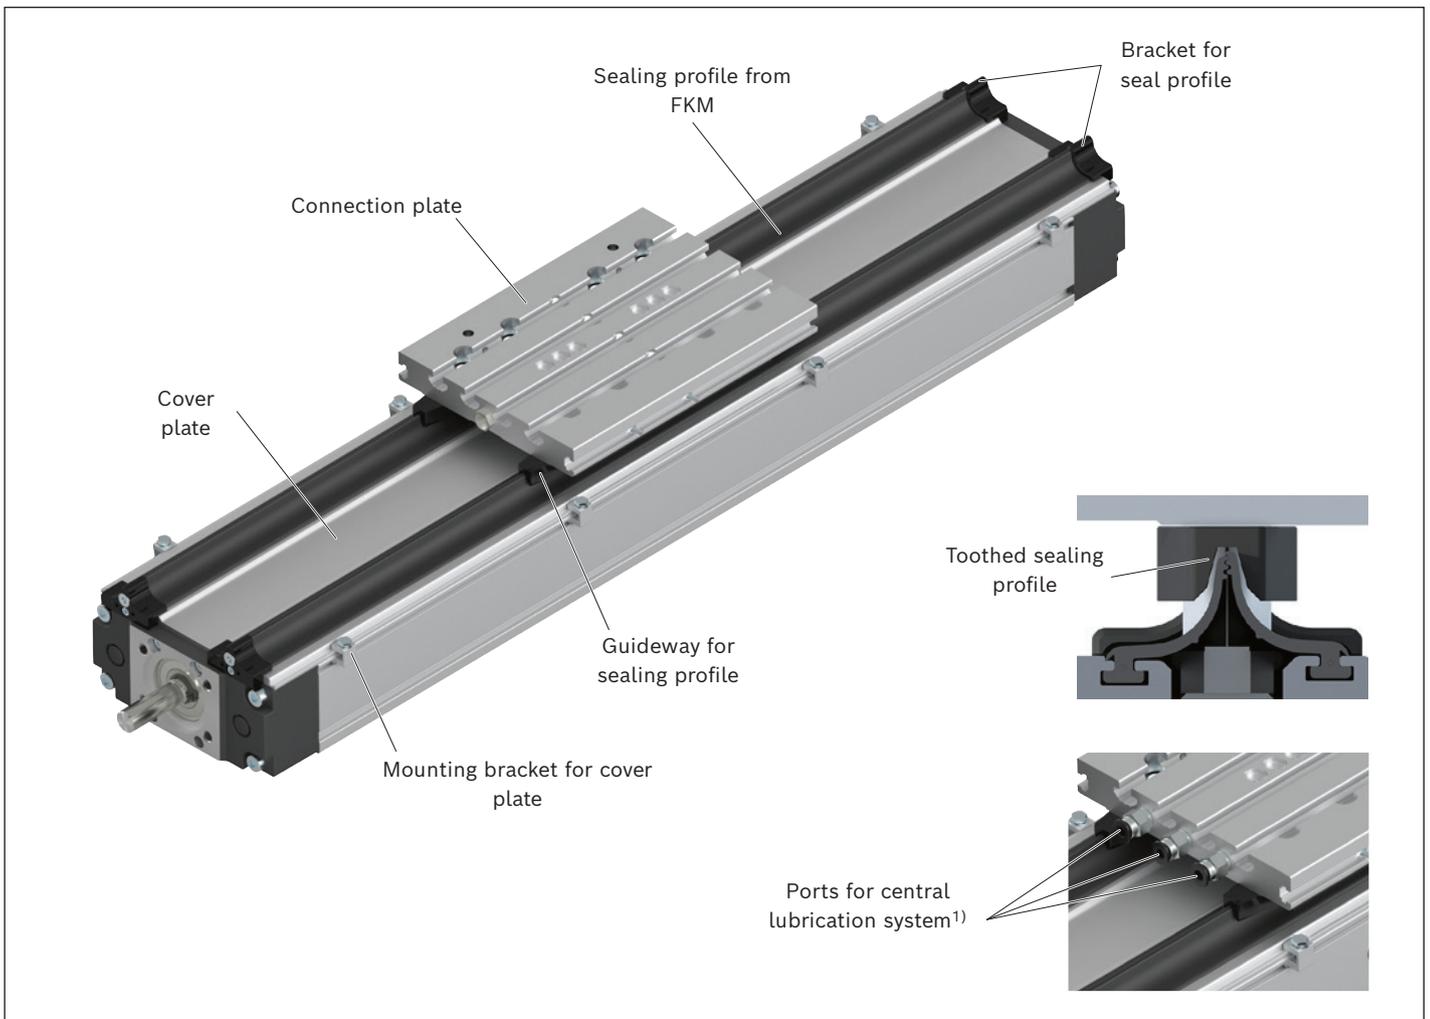

**"Resist" cover**

**Structural design:**

- ▶ Sizes: CKK-110/-145/-200
- ▶ Possible for version with connection plate

**Features:**

- ▶ Increased protection thanks to the toothed sealing profile
- ▶ The integrated guideway on the carriage ensures the sealing profile interlocks perfectly
- ▶ Sealing profile made of flexible FKM – material
- ▶ Free of LABS (substances harmful to paint structure)
- ▶ Replaceable sealing profile
- ▶ The sealing profile has a short-term temperature resistance of up to 300°C
- ▶ Suitable for exposure to dry chips with broken chips of aluminum and component handling during welding application
- ▶ Selectable with all lube versions

<sup>1)</sup> See chapter "Lubrication"

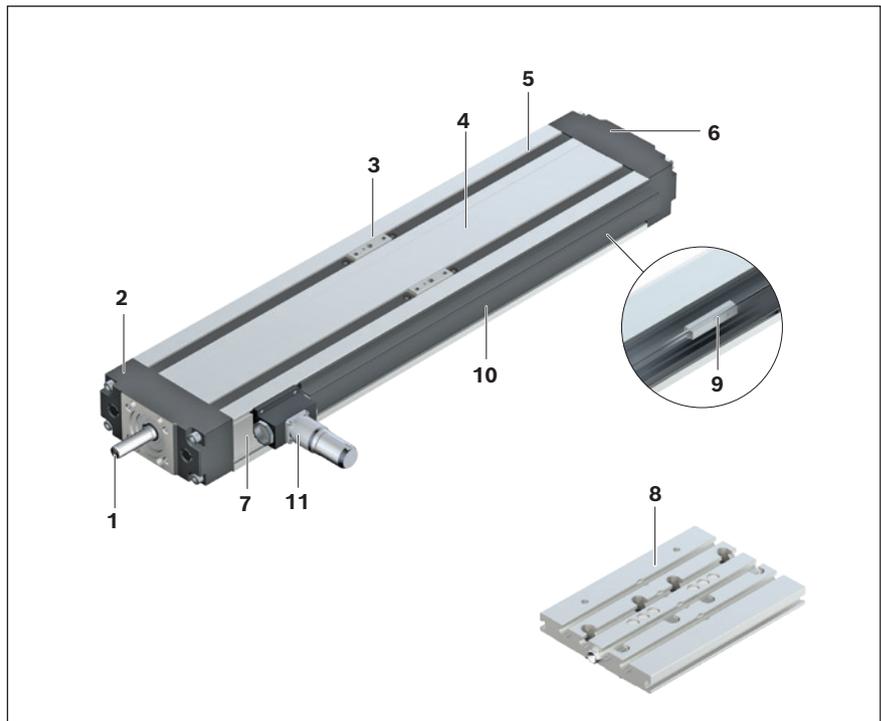

## Structural design

### Structural design CKK

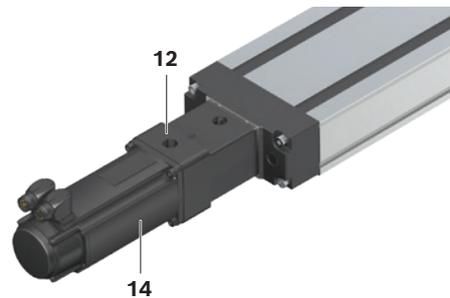

- 1 Ball screw assembly with zero-backlash single nut
- 2 Drive side cross tie
- 3 Carriage with integrated runner block
- 4 Cover plate
- 5 Cover strip made of reinforced strip PU
- 6 End block
- 7 Frame

### Attachments:

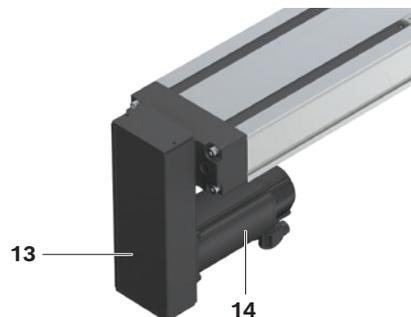

- 8 Connection plate
- 9 Magnetic sensor
- 10 Cable duct
- 11 Socket/connector
- 12 Flange and coupling
- 13 Belt side drive
- 14 Motor

Motor attachment – flange and coupling

Motor attachment – belt side drive

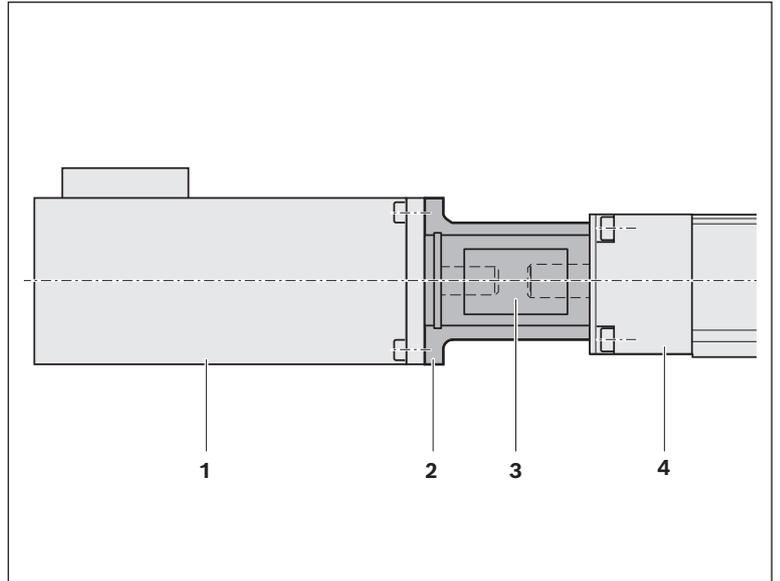

**Structure of flange and coupling**

A motor can be attached to all compact modules with ball screw assembly by means of a flange and coupling.

The flange serves to fasten the motor to the compact module and acts as a closed housing for the coupling. The motor's drive torque is transmitted stress-free through the coupling to the compact module's drive journal.

Our standard couplings compensate for the system's thermal expansion.

- 1 Motor
- 2 Flange
- 3 Coupling
- 4 Compact module

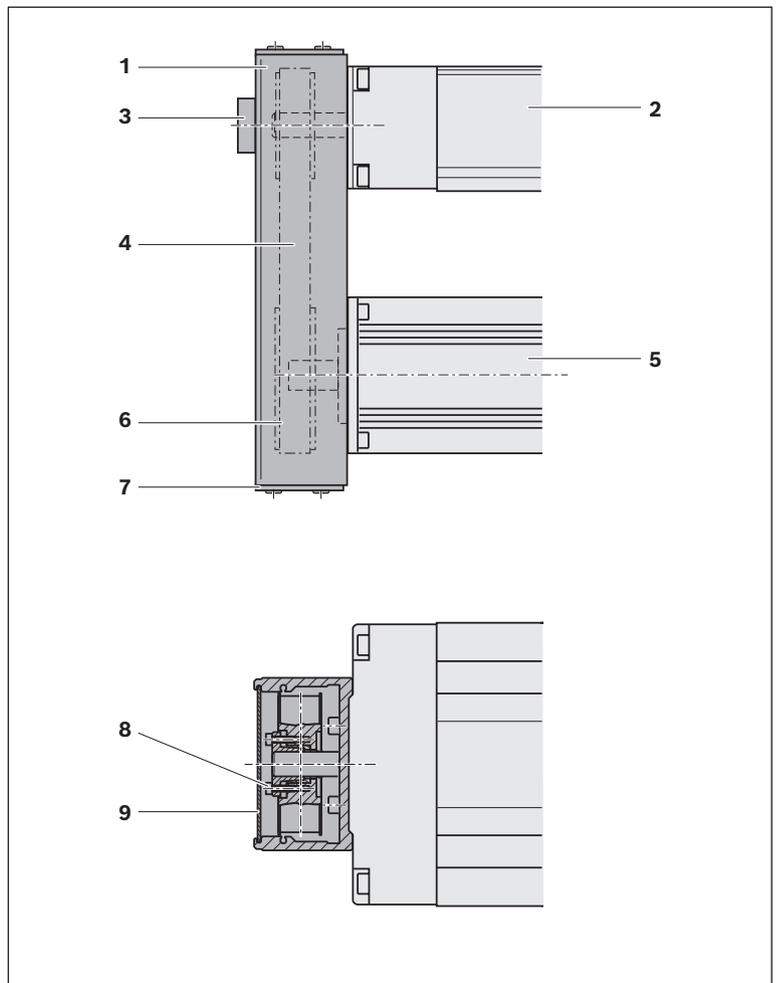

**Structure of belt side drive**

All compact modules with ball screw assembly offer the option of attaching the motor via a belt side drive. This makes the overall length shorter than when attaching the motor with flange and coupling. The space-saving, closed pulley housing serves as protection for the belt and as a motor bracket. In addition, various gear ratios are also available (depending on size).

The belt side drive can be mounted in four different directions:

- ▶ Below, above (RV01 and RV02)
- ▶ Left, right (RV03 and RV04)

- 1 Pulley housing made of anodized aluminum frame
- 2 Compact module
- 3 Support bearing at the screw journal in size CKK-070
- 4 Toothed belt drive
- 5 Motor
- 6 Toothed belt drive
- 7 Cover
- 8 Belt pulleys with tensioning units
- 9 Cover plate

Technical data

**General technical data**

Size -200/-280 → next page

- 1) In the "without connection plate" version, carriage length L<sub>ca</sub> corresponds to the dimension of the outer edge to outer edge of the fastening bridges. Dynamic characteristic values and maximum permissible loads are valid only when connecting the fastening bridges via customer-built attachment.
- 2) The connection plate is mounted on the "without connection plate" carriage version.  
 In the "with connection plate" version, carriage length L<sub>ca</sub> corresponds to the length of the connection plate.
- 3) A variable center-to-center distance L<sub>W</sub> is only possible for the "without connection plate" carriage design.  
 The variable center-to-center distance is freely selectable between minimum and maximum distance in millimeters steps.
- 4) Minimum required travel range to ensure a reliable lubrication distribution.
- 5) For the variable L<sub>W</sub>, M<sub>t</sub>, M<sub>y max</sub> and M<sub>z max</sub> must be determined according to the selected centerline-to-centerline distance L<sub>W</sub>.
- 6) → "Resist chapter".

- 1) In the "without connection plate" version, carriage length L<sub>ca</sub> corresponds to the dimension of the outer edge to outer edge of the fastening bridges. Dynamic characteristic values and maximum permissible loads are valid only when connecting the fastening bridges via customer-built attachment.
- 2) The connection plate is mounted on the "without connection plate" carriage version.  
 In the "with connection plate" version, carriage length L<sub>ca</sub> corresponds to the length of the connection plate.
- 3) A variable center-to-center distance L<sub>W</sub> is only possible for the "without connection plate" carriage design.  
 The variable center-to-center distance is freely selectable between minimum and maximum distance in millimeters steps.
- 4) Minimum required travel range to ensure a reliable lubrication distribution.
- 5) For the variable L<sub>W</sub>, M<sub>L</sub>, M<sub>y max</sub> and M<sub>z max</sub> must be determined according to the selected centerline-to-centerline distance L<sub>W</sub>.
- 6) ➔ "Resist chapter".

<sup>1)</sup> For greater lengths, the permissible drive torque is determined from the length-variable value M<sub>p</sub> of the linear motion system in accordance with the graph  
 → Chapter "Project planning/calculation"

<sup>2)</sup> Values for M<sub>sd</sub> do not factor in motor torque.

**Drive data for motor attachment via flange and coupling**

Diagrams

**Permissible drive torque**

The values shown for  $M_p$  apply under the following conditions:

- ▶ Screw journal without keyway
- ▶ No radial loads on screw journal

**⚠ Keep in mind the rated torque of the coupling being used! Keep in mind the minimum travel range  $s_{min}$ !**

**⚠ Screw journal with keyway**

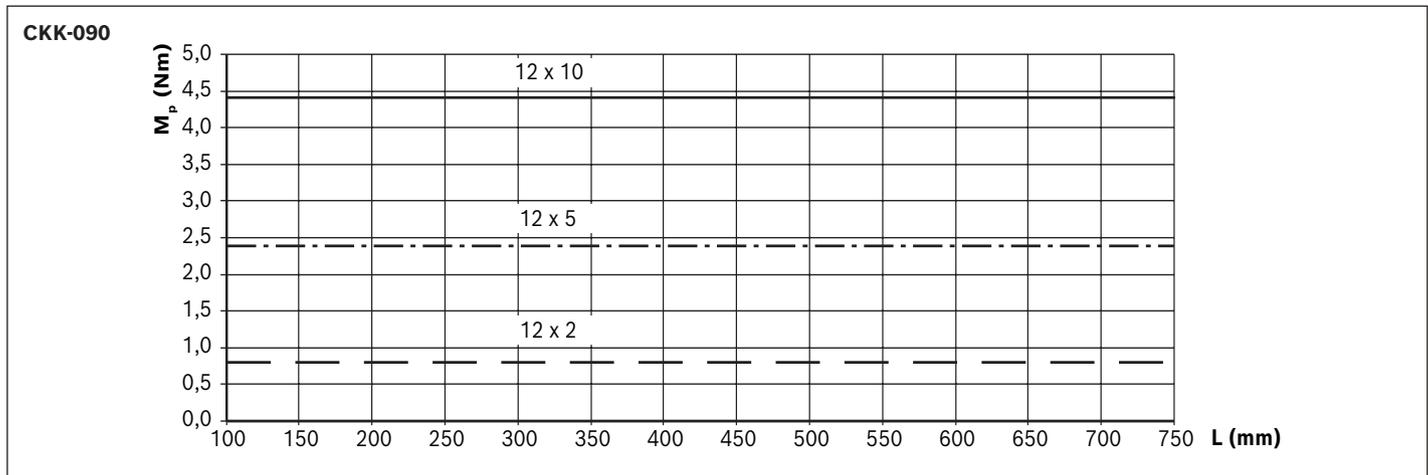

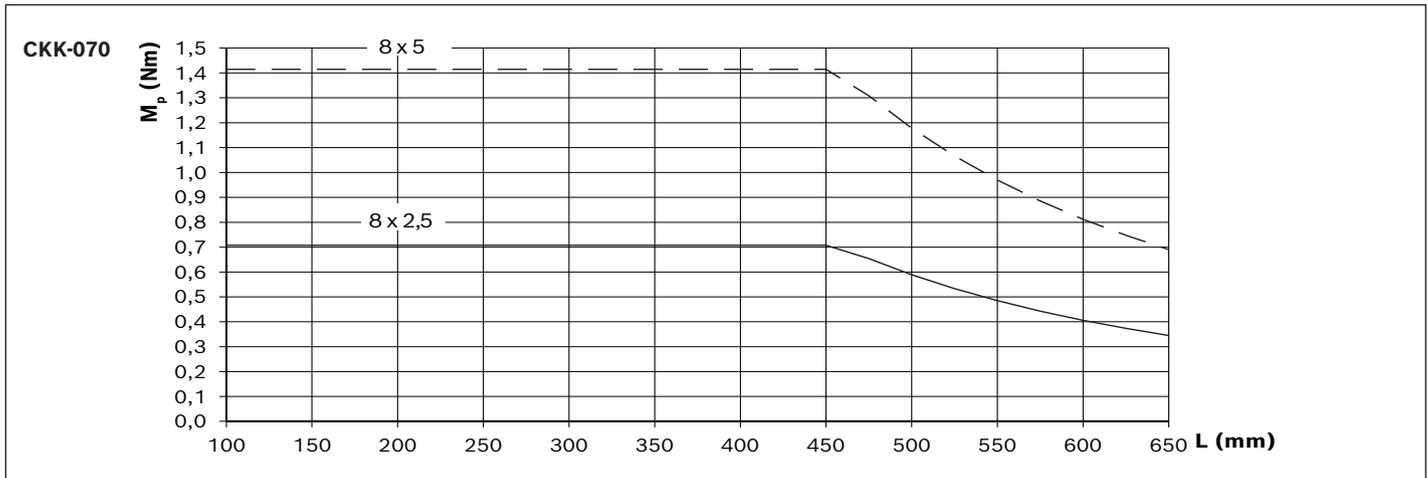

For reasons of stress concentration and a reduction of the effective diameter, observe the maximum values for drive torque!

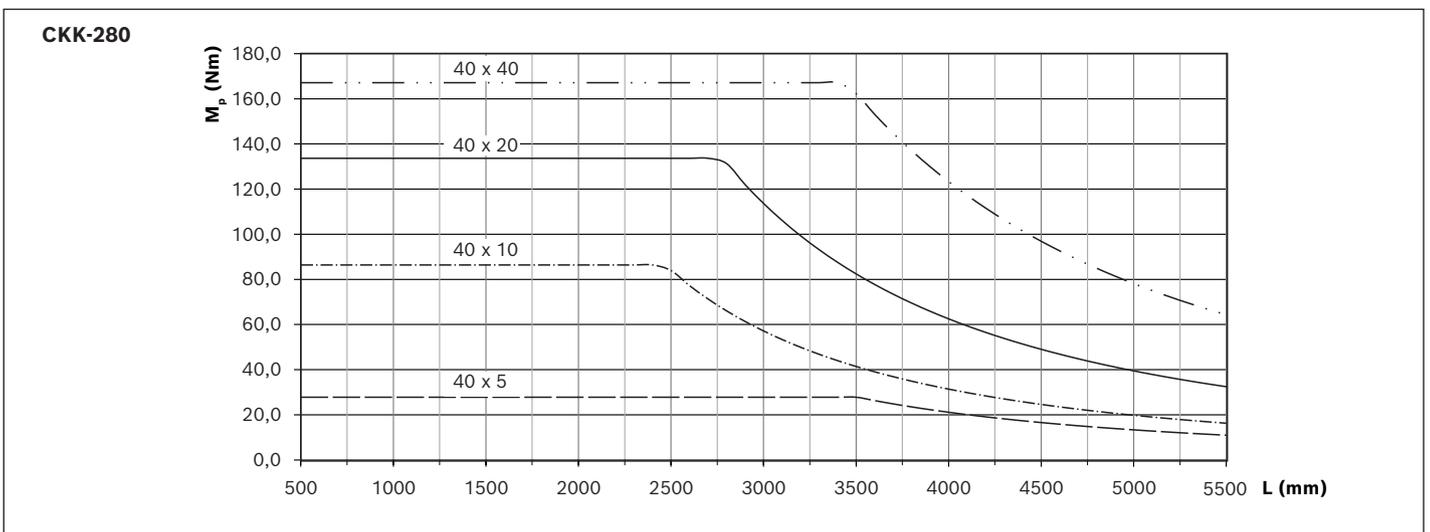

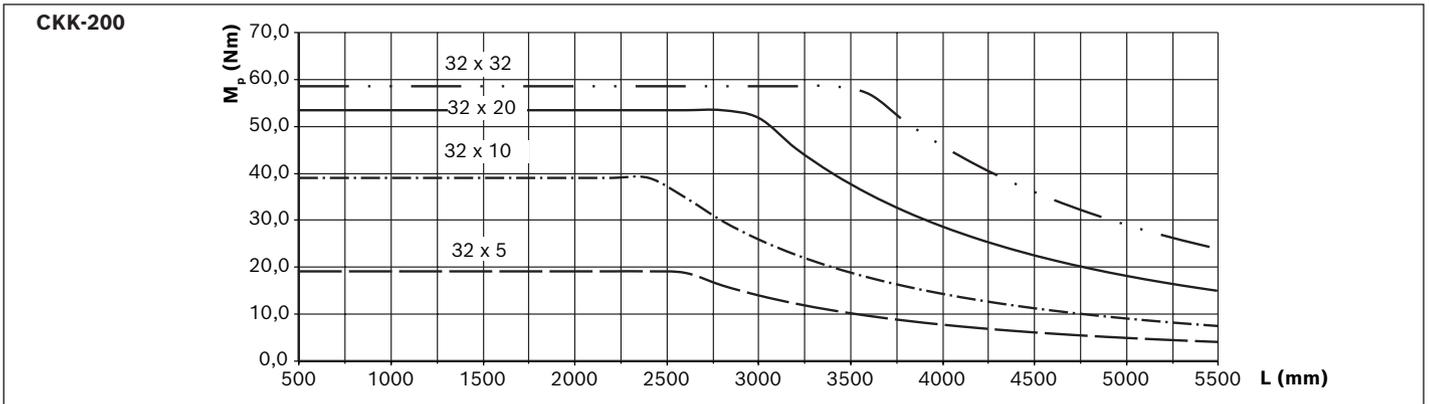

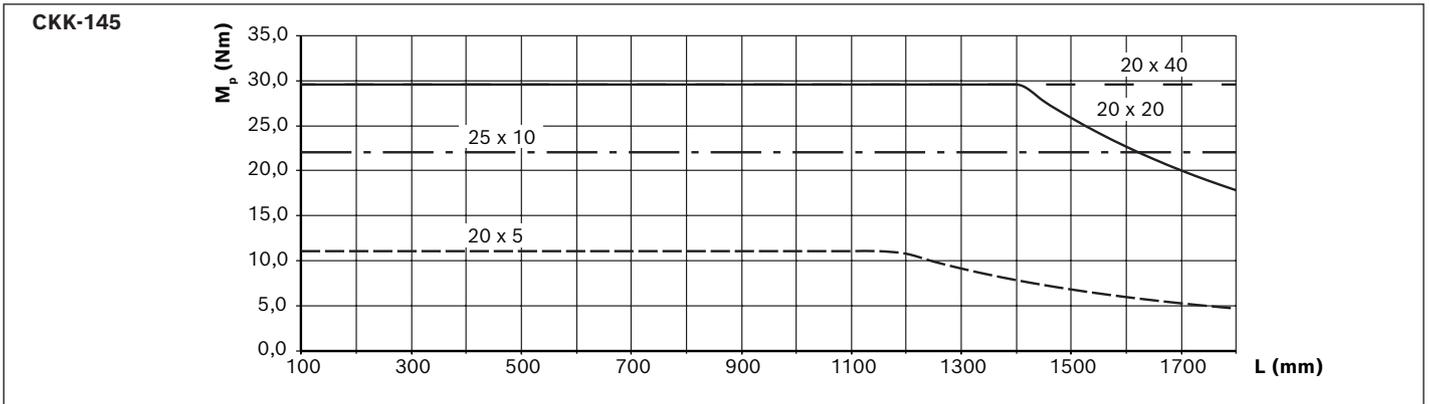

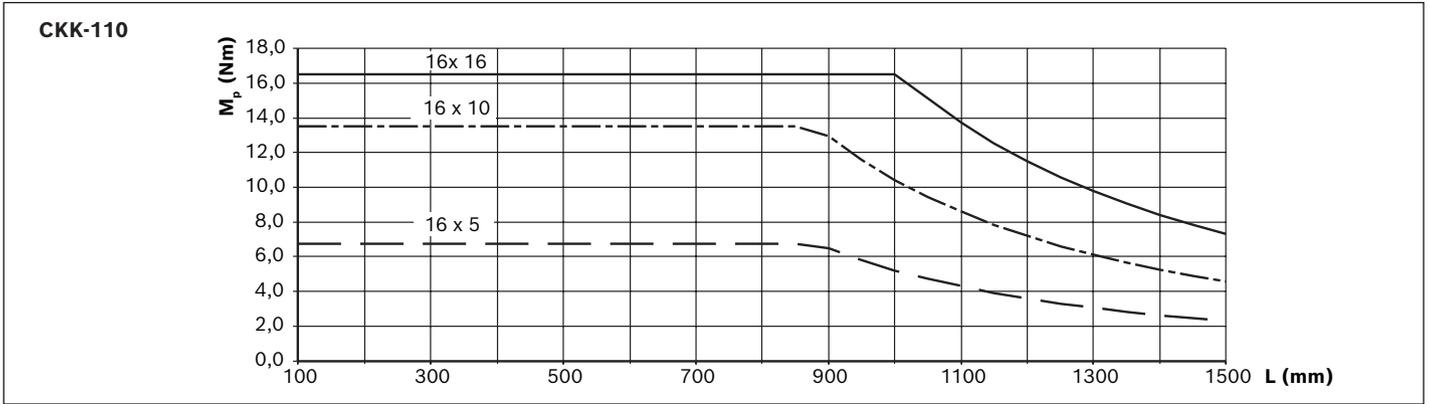

CKK	$M_p$ (Nm)
-110 / -145	No reduction
-200	48.6

**⚠ For ball screw assemblies with keyway, the smallest value from the diagrams and the table is valid.**

Example:

CKK-200	$(d_o \times P)$	
	32 x 32	32 x 10
Length (mm)	1,500	1,500
$M_p$ from diagram (Nm)	58.5	39.0
$M_p$ maximum (Nm)	48.6	48.6
Value for sizing	48.6	39.0

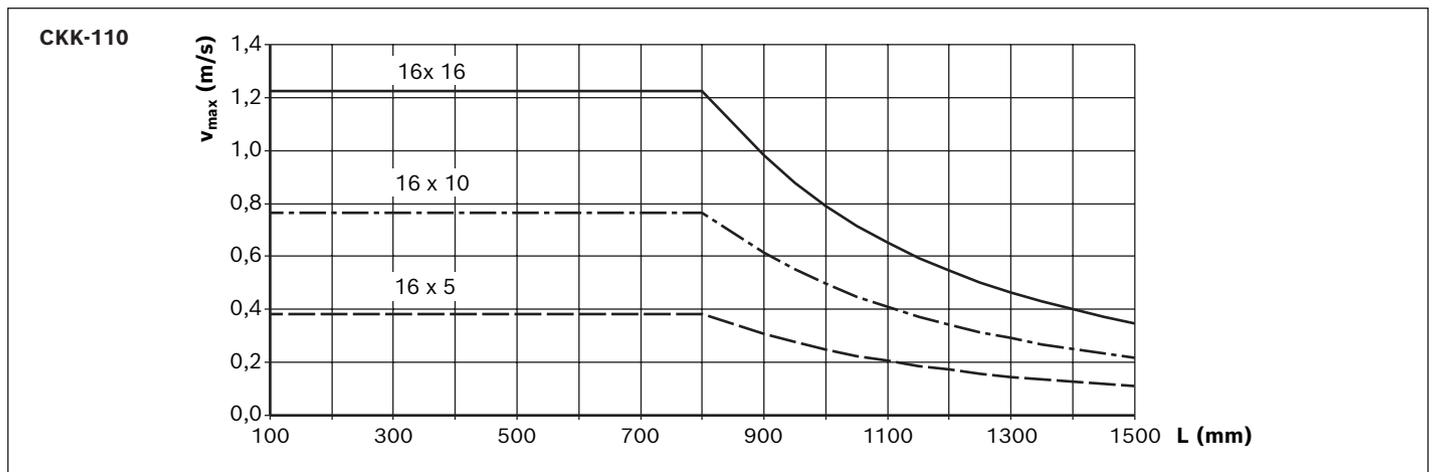

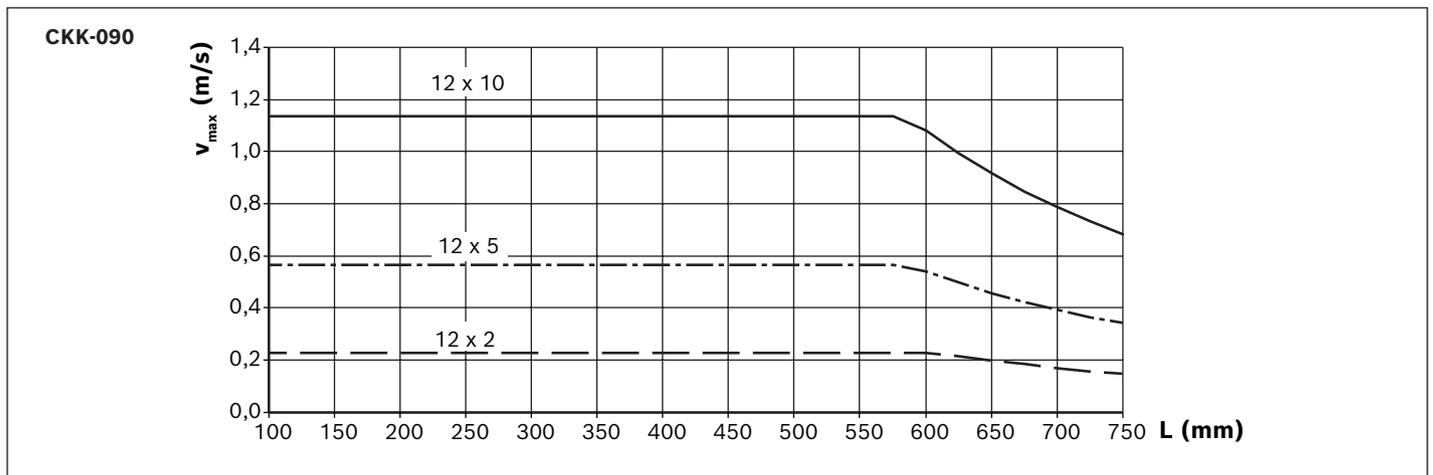

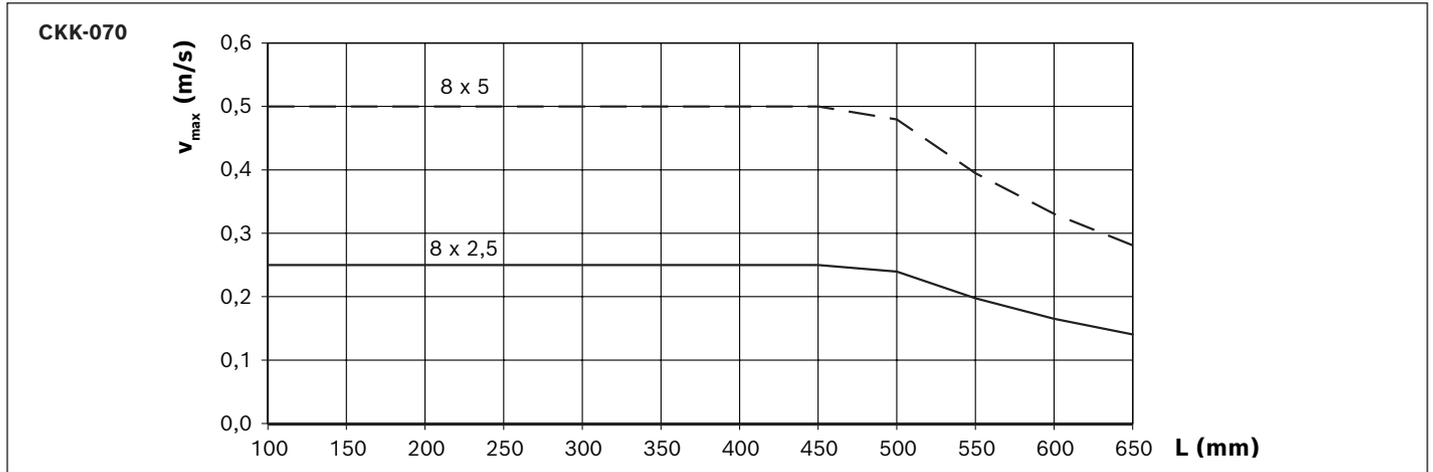

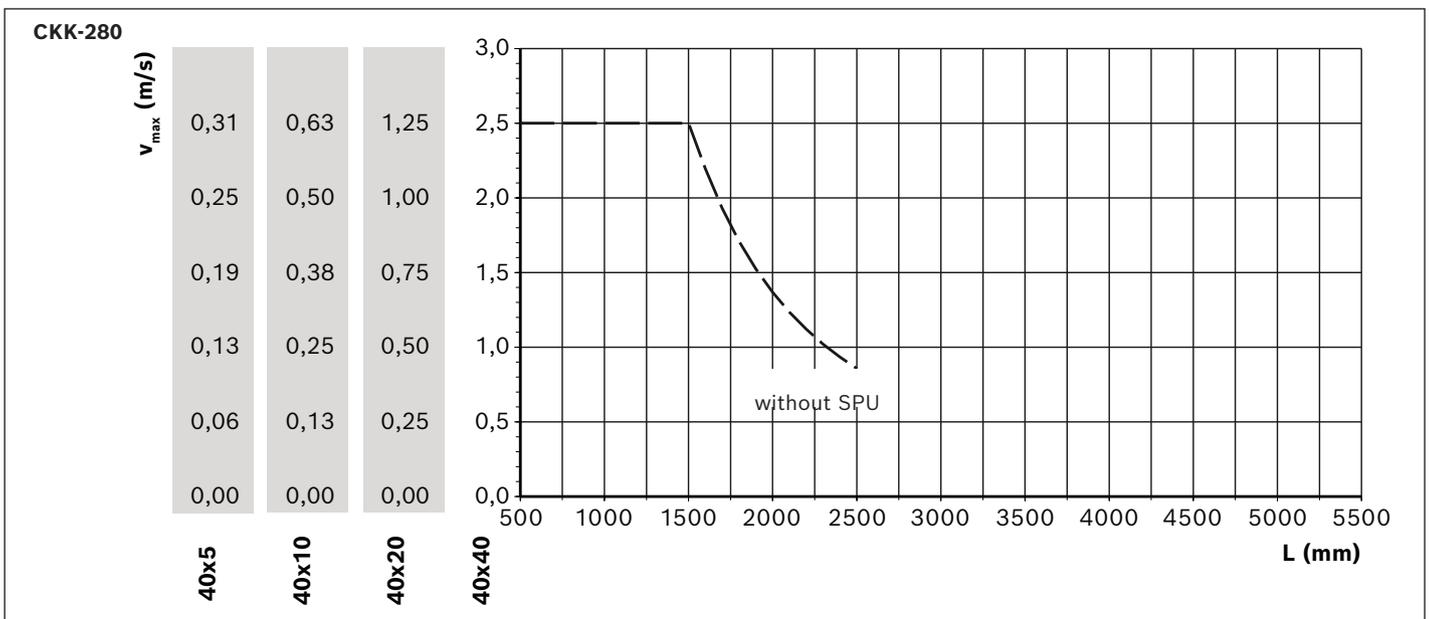

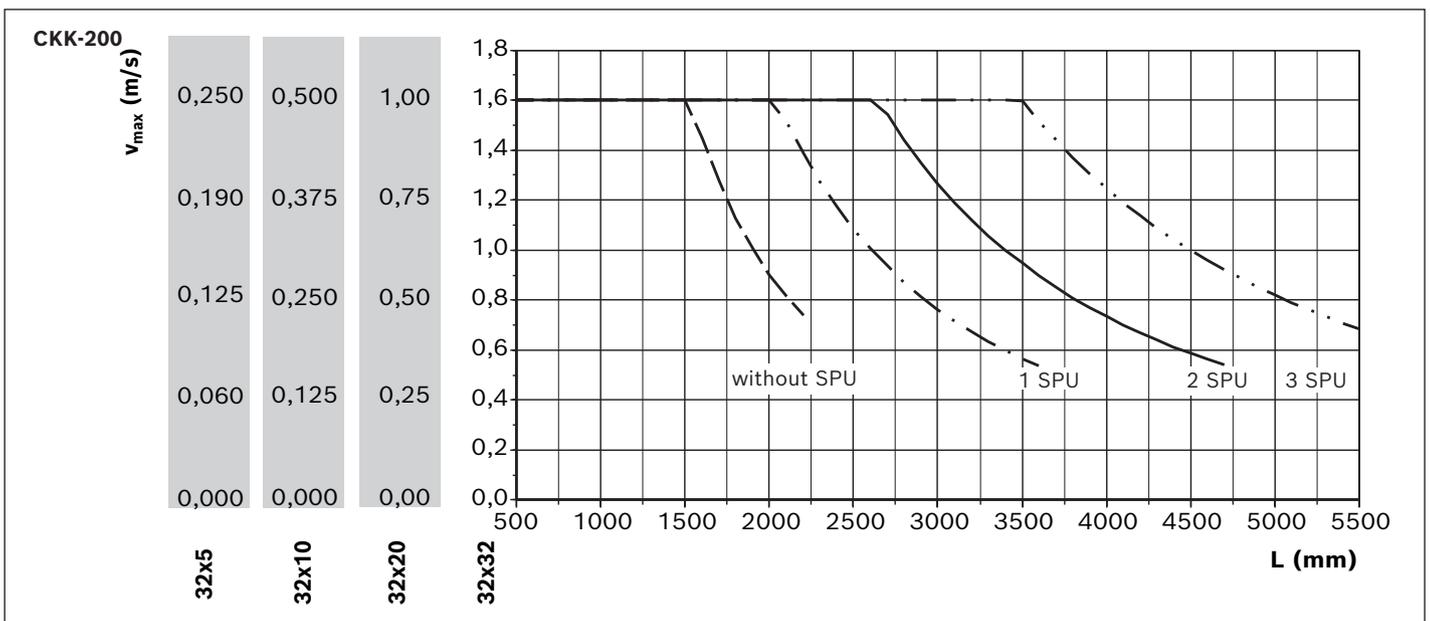

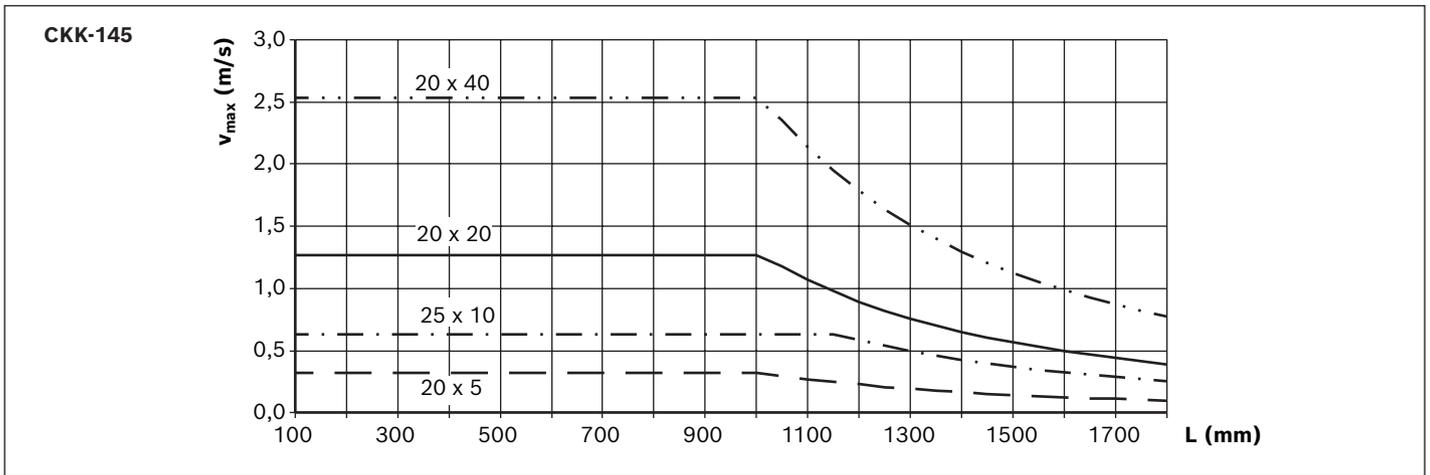

**Permissible speed**

Observe motor speed!

Keep in mind the minimum travel range  $s_{min}$ !

Configuration, order

								-		024	-					209

- 1) Length calculation of the linear motion system ⇒ "Project planning/calculation" chapter.
- 2) Centering holes for simple combination with other linear motion systems and connection elements (⇒ Dimension drawings).  
Option 003: with centering holes and fastening threads in the ground area of the frame  
Option 004: with centering holes and long hole in the ground area of the frame; selectable starting from length L ≥ 300 mm up to length L<sub>max</sub>
- 3) Lubrication ⇒ Chapter "Lubrication".
- 4) Attachment kit also available without motor. When ordering, enter the motor type "000"! Attachment kits according to customer specifications ⇒ Chapter "Attachment Kits for Motors according to Customer Specifications"
- 5) Recommended motor, motor data and type designations ⇒ Chapter "Motors"
- 6) Only possible with version Carriage with connection plate L<sub>ca</sub> = 190 mm;  
Switch mounting only possible with magnetic sensor with connector. (It may be necessary to move the mounting brackets for Resist cover)
- 7) More information ⇒ Chapter "Switching system"
- 8) Assembly contains 1 x sensor, 1 x switch mounting plate including set screws and square nuts as well as 3 x cable holders including set screws
- 9) Measurement report: 001 = Standard report; 002 = Measurement of frictional torque; 003 = Lead deviation (⇒ Chapter "Documentation")

Chapter "Motors"

# Compact modules with toothed belt drive (CKR)

## Product overview

### Features

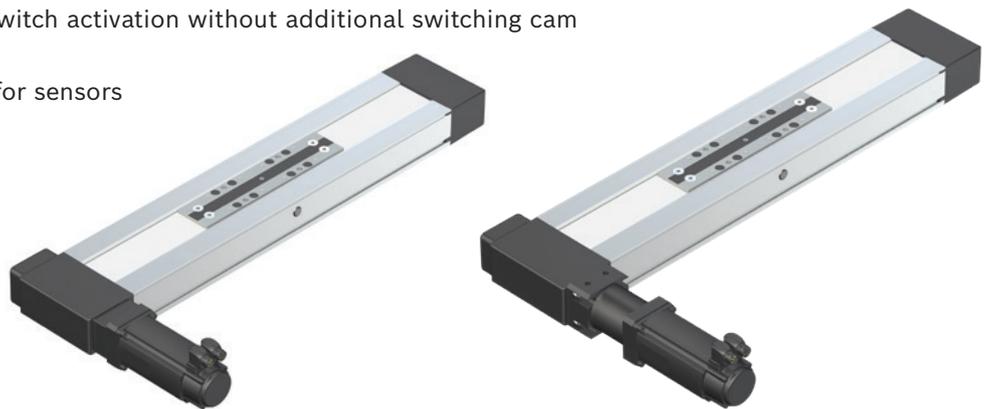

- ▶ Six fine-tuned sizes based on a compact precision aluminum profile with two integrated preloaded ball rail systems
- ▶ Four different lube versions
- ▶ Ready-to-install compact modules in any length up to  $L_{\max}$ .
- ▶ Realization of greater lengths of up to 10,000 mm
- ▶ Preloaded toothed belt
- ▶ Aluminum carriages available in different lengths
- ▶ Intelligent toothed belt guide protects inner components
- ▶ Low-cost maintenance
- ▶ Repeatability of up to  $\pm 0.05$  mm

### Further highlights

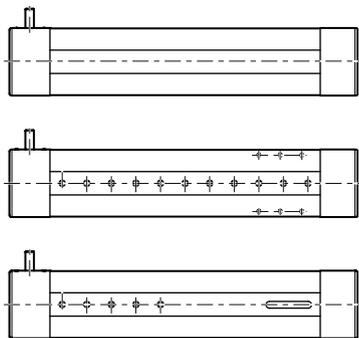

- ▶ Flexible thanks to selectable options
- ▶ Centering holes for simple combination with other linear motion systems and connection elements
- ▶ Extensive accessories for connection and clamping units
- ▶ Nameplate with parameters for easy commissioning

### Attachments

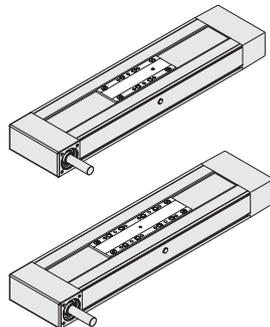

- ▶ Planetary gear with various gear ratios
- ▶ Maintenance-free servo motors with selectable brake and attached feedback
- ▶ Switches (magnetic sensors), switch activation without additional switching cam
- ▶ Socket and connector
- ▶ Cable duct made of aluminum for sensors

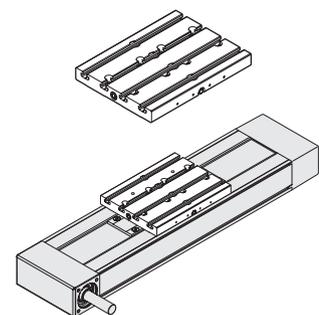

### Design/options for guideway (frame), carriages, connection plates

Guideway (frame)

Carriages

Connection plates

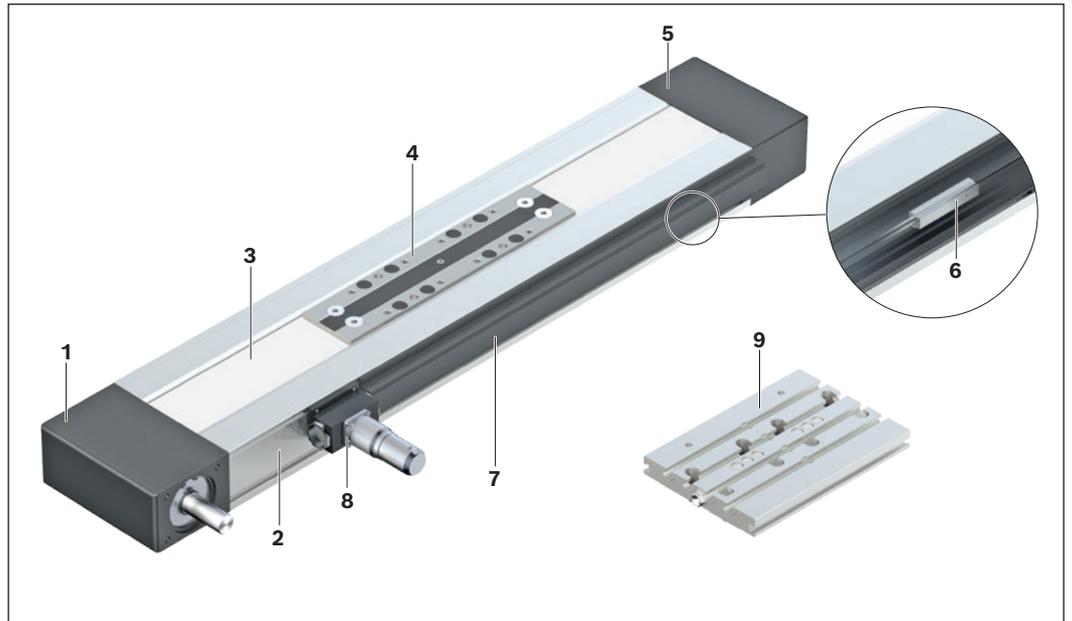

## Structural design

### Structural design CKR

- 1 Drive end enclosure
- 2 Frame
- 3 Toothed belt drive
- 4 Carriage
- 5 Idler end enclosure

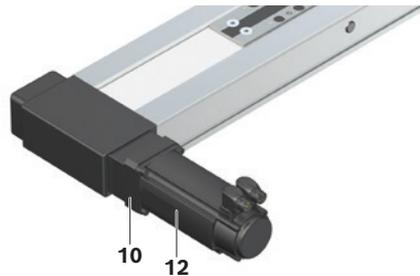

### Attachments:

- 6 Magnetic sensor
- 7 Cable duct
- 8 Socket/connector
- 9 Connection plate
- 10 Flange
- 11 Planetary gear
- 12 Motor

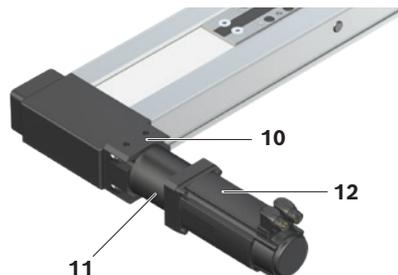

### Motor attachment – direct attachment with $i = 1$ (depending on size)

The motor is attached directly to the compact module's drive end enclosure via a flange.

### Motor attachment – with gear (depending on size)

The planetary gear is attached by means of a flange. The flange serves to fasten the gearbox to the CKR and as a closed housing. Due to the connection without coupling, the drive torque is transferred to the drive shaft of the compact module in a torsionally stiff manner. Available gear ratios → "configuration, ordering".

Technical data

**General technical data**

Observe the "Project planning/calculation" chapter.

1) In the "without connection plate" carriage version, carriage length L<sub>ca</sub> corresponds to the length of the clamping surface.  
 2) The connection plate is mounted on the "without connection plate" carriage version.  
 In the "with connection plate" carriage version, the carriage length corresponds to the length of the connection plate.  
 3) Minimum required travel range to ensure a reliable lubrication distribution.  
 4) Maximum force that can be transmitted via the teeth meshing with the belt pulley.

1) Length calculation of the linear motion system ⇒ "Project planning/calculation" chapter.  
 2) Centering holes for simple combination with other linear motion systems and connection elements (⇒ Dimension drawings).  
 Option 003: with centering holes and fastening threads in the ground area of the frame.  
 Option 004: with centering holes and long hole in the ground area of the frame. Selectable starting from length  $L \geq 300$  mm up to length  $L_{max}$   
 3) Lubrication ⇒ Chapter "Lubrication".  
 4) Attachment kit for gear attachment  
 5) If a module has been ordered with an attached servo motor, it will only be delivered with the motor mounting shown in the chapter "Form of delivery" (note position of motor connector).  
 6) Recommended motor, motor data and type designations ⇒ Chapter "Motors"  
 7) More information ⇒ Chapter "Switching system".  
 8) Assembly contains 1 x sensor, 1 x switch mounting plate including set screws and square nuts as well as 3 x cable holders including set screws  
 9) Measurement report: 001 = Standard report; 002 = Measurement of frictional torque; (⇒ Chapter "Documentation")  
 10) Motor attachment consisting of: Adapter flange for gear unit, however "without gear unit". No motor connector position selectable.

- 1) Length calculation of the linear motion system ⇒ "Project planning/calculation" chapter.
- 2) Centering holes for simple combination with other linear motion systems and connection elements (⇒ Dimension drawings).  
Option 003: with centering holes and fastening threads in the ground area of the frame. Selectable up to a length of  $L \leq 2000$  mm  
Option 004: with centering holes and long hole in the ground area of the frame. Selectable starting from length  $L \geq 300$  mm up to length  $L_{max}$
- 3) Lubrication ⇒ Chapter "Lubrication".
- 4) Attachment kit for gear attachment
- 5) If a module has been ordered with an attached servo motor, it will only be delivered with the motor mounting shown in the chapter "Form of delivery" (note position of motor connector).
- 6) Recommended motor, motor data and type designations ⇒ Chapter "Motors"
- 7) More information ⇒ Chapter "Switching system".
- 8) Assembly contains 1 x sensor, 1 x switch mounting plate including set screws and square nuts as well as 3 x cable holders including set screws
- 9) Measurement report: 001 = Standard report; 002 = Measurement of frictional torque; (⇒ Chapter "Documentation")
- 10) Motor attachment consisting of: Adapter flange for gear unit, however "without gear unit". No motor connector position selectable.

# Attachments and accessories

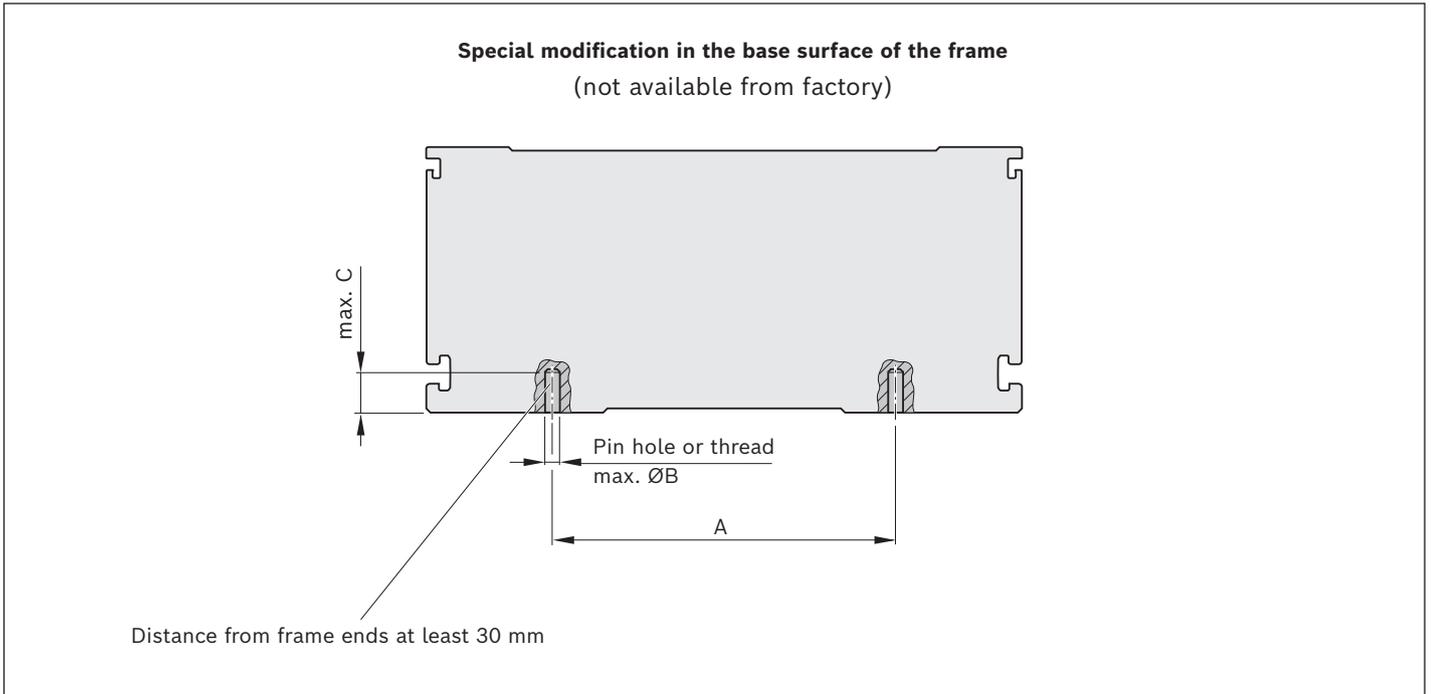

## Mounting/mounting accessories

**1** For compact modules with centering holes in the ground area (selection via the guideway option):  
 Use centering rings to better align to other linear motion systems and connection elements.

**⚠ Do not fasten or support the compact module at the end enclosures! The frame is the load-bearing part!**

Size	Dimensions (mm)		
	A	B	C
-070	82	95	-
-090	102	112	-
-110	126	140	-
-145	161	175	-
-200	222	240	150
-280	310	336	204

Mounting by means of special modification in the base surface of the frame is possible

**⚠ Option guideway 003 already includes threaded holes in the ground area of the frame (see dimension drawings).**

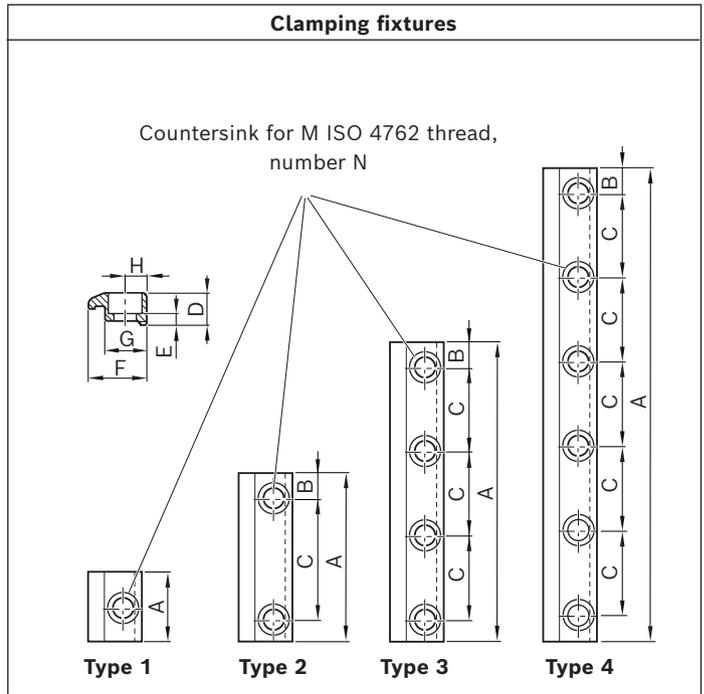

Size	Dimensions (mm)		
	A	B	C
-070	59	3	7.5
-090	76	4	7.5
-110	92	5	9.0
-145	124	6	13.0
-200	119	8	12.0
-280	242	15	10.0

**Mounting accessories**

Recommended number of clamping fixtures:

- ▶ Type 1: 6/3<sup>1)</sup> pieces per meter and side
- ▶ Type 2: 4 pieces per meter and side
- ▶ Type 3: 3 pieces per meter and side
- ▶ Type 4: 3 pieces per meter and side

<sup>1)</sup> For size 070

Compact modules CKR: When mounting the clamping fixtures, observe a minimum distance of 10 mm to the end face of the frame.

**Sliding blocks, springs and strips**

Recommended number of sliding blocks:  
with 1 thread, 6 pieces per meter and side

For fastening attachments on the connection plate.  
The spring serves as assembly and positioning aid.

**Centering rings**

The centering ring serves as a positioning aid and for positive locking when mounting customer-built attachments to the carriage and the frame.

It creates a positive-locking connection with good reproducibility.

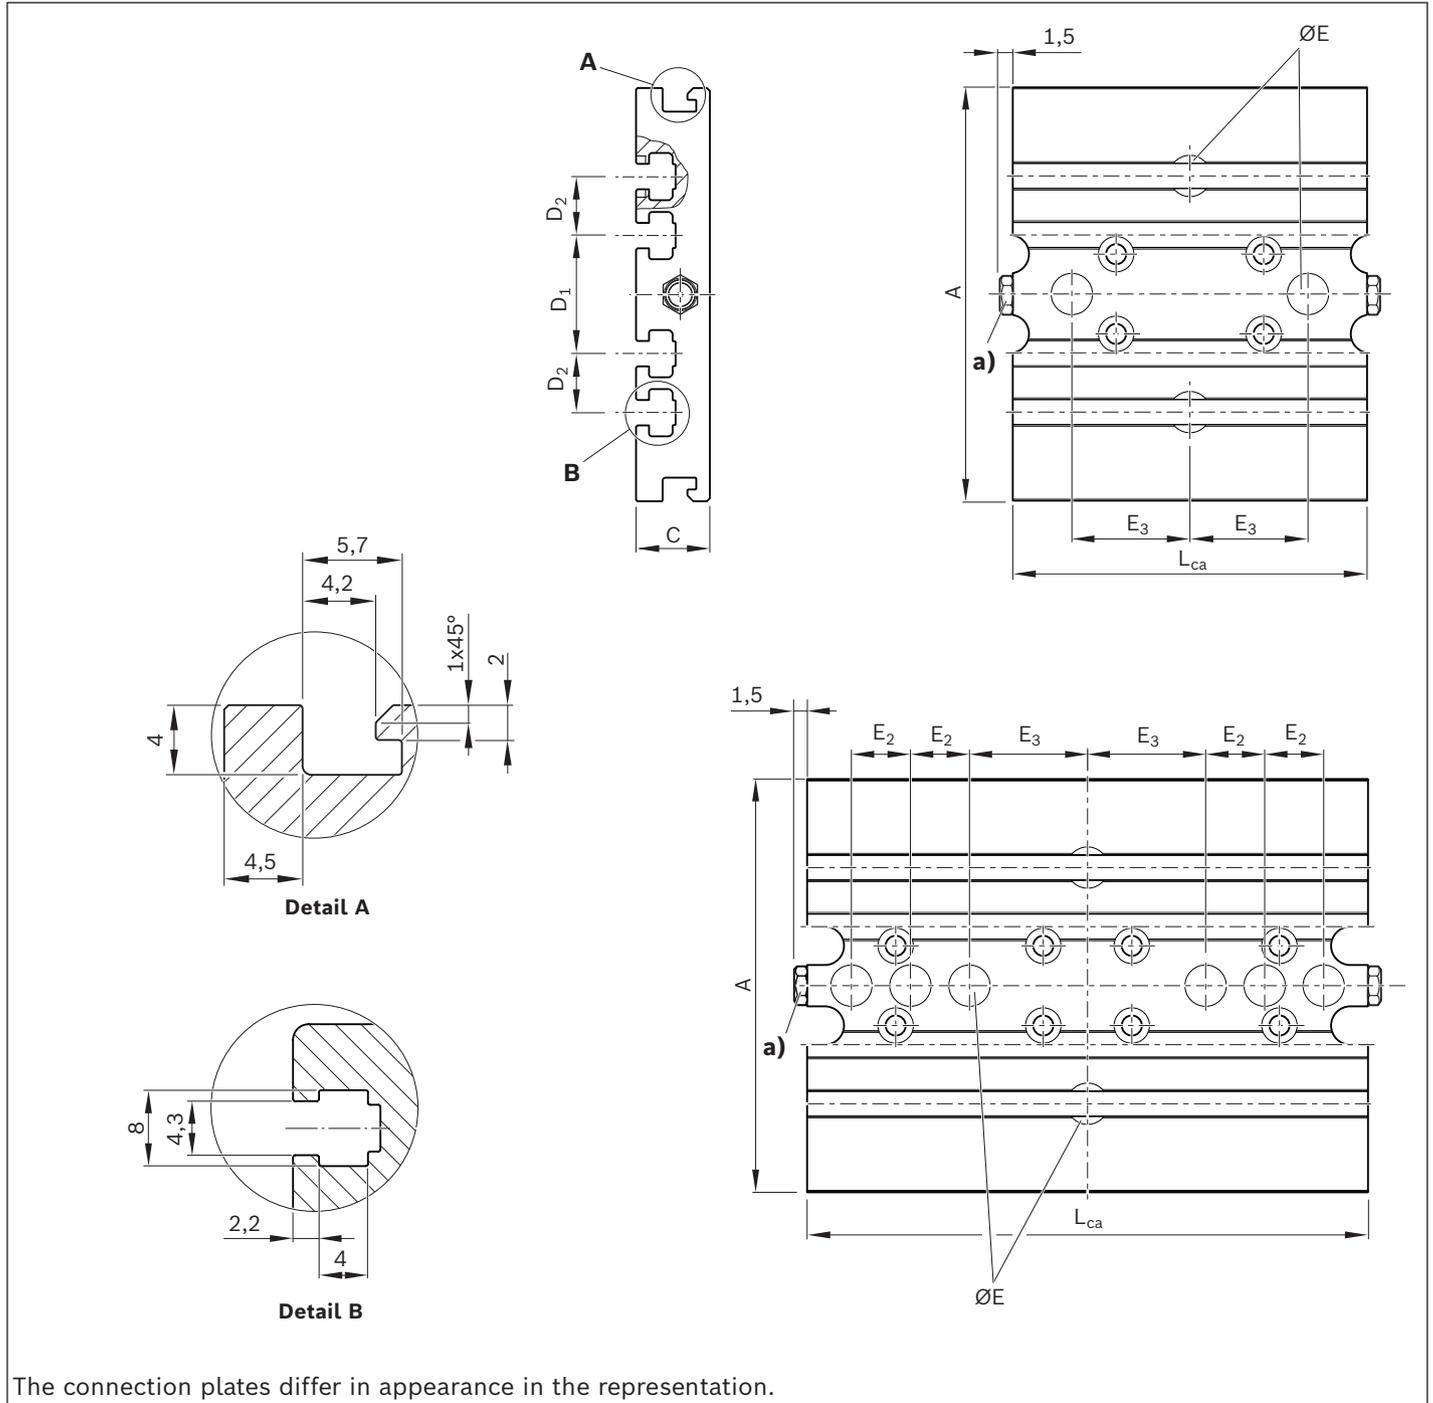

Material: Steel

Connection plates

CKK/CKR -070

The connection plates differ in appearance in the representation.

- a) Funnel-type lube nipple DIN 3405-D4; lubrication points from two sides (central lubrication only necessary with grease gun on one of the two sides).

**Function:**

- ▶ Fastening of attachments (with sliding blocks)
- ▶ Lubrication of the ball rail system and the ball screw assembly possible via the connection plate
- ▶ For lube version LSS, LPG

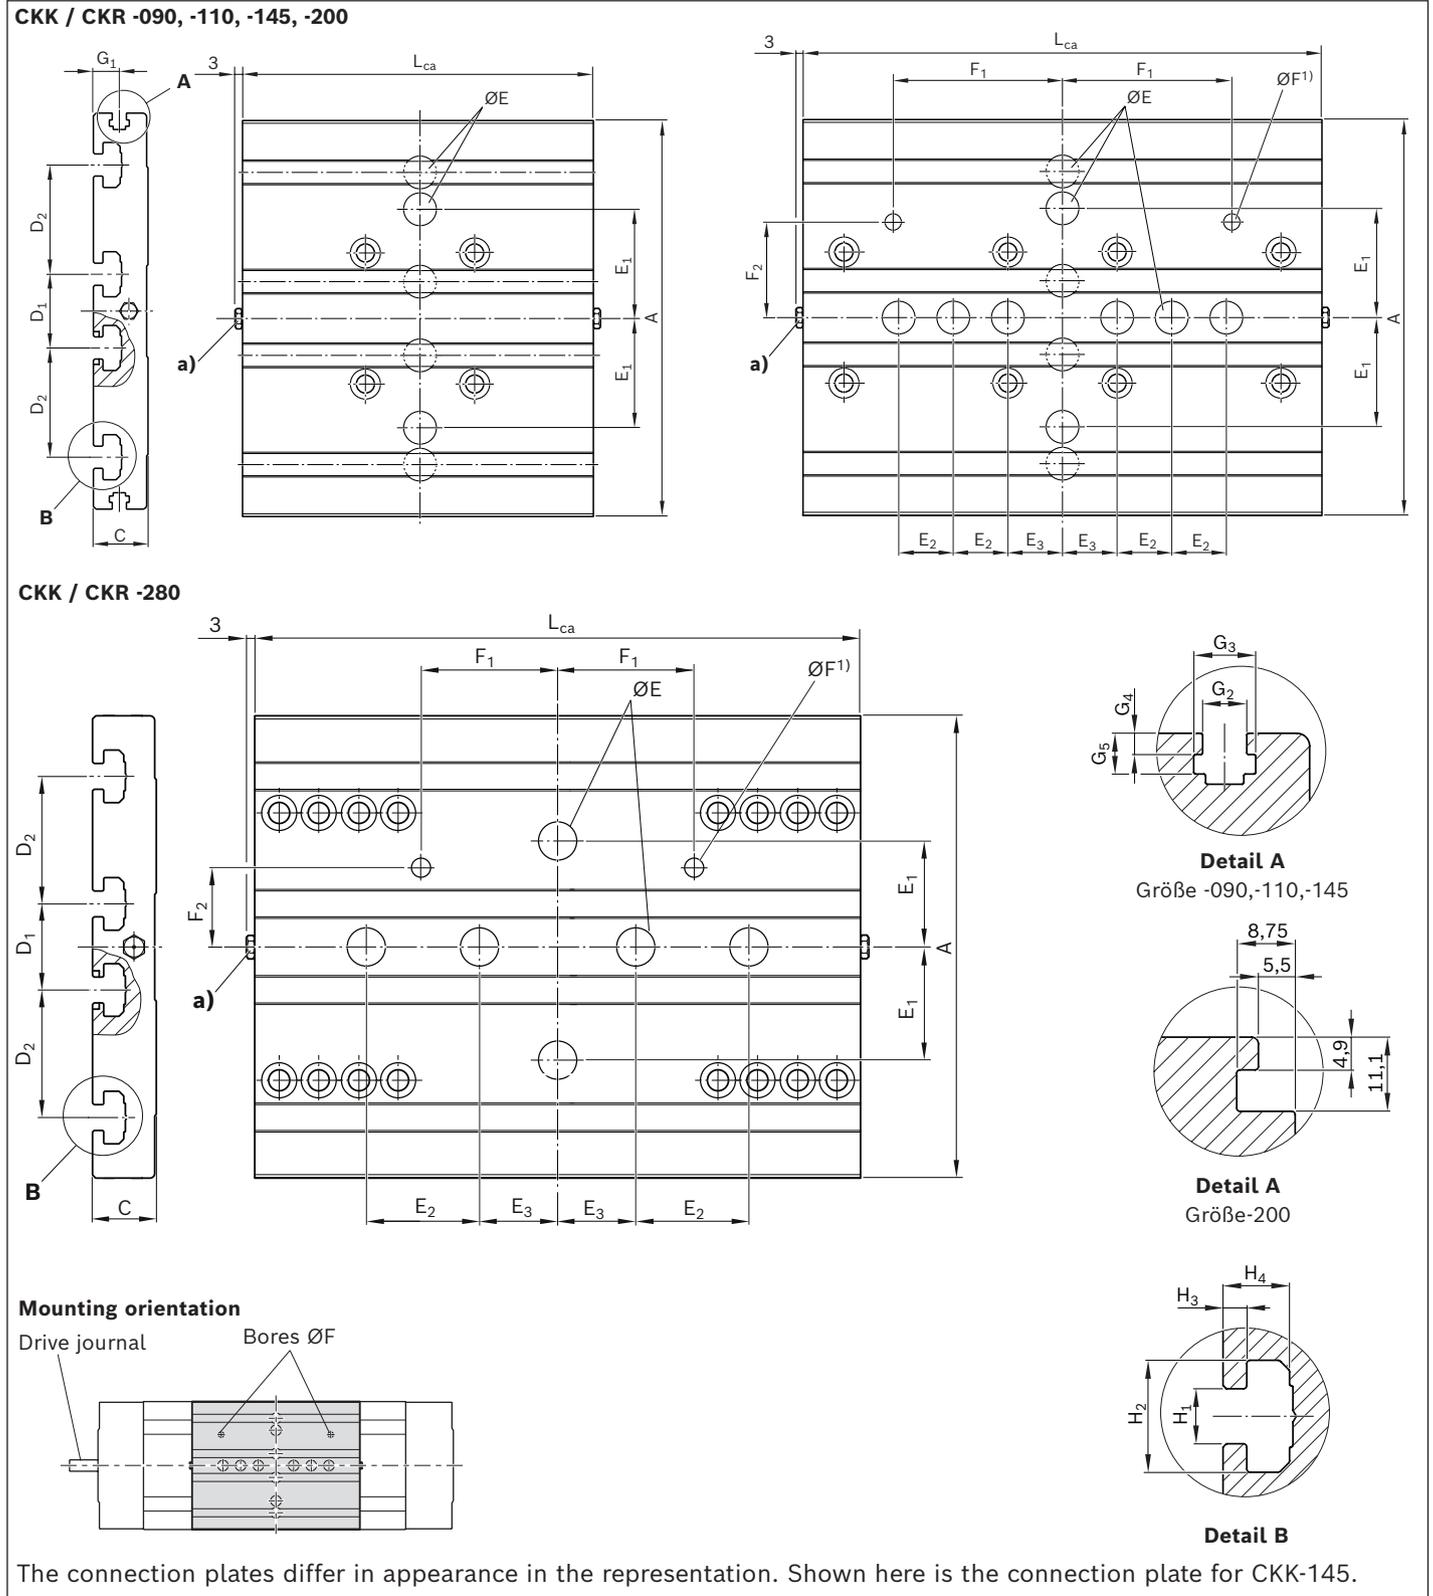

**The assembly consists of:**

- ▶ Connection plate
- ▶ Mounting accessories for fastening to the carriages
- ▶ Sliding blocks are not included with delivery

## Connecting shafts

### Features

- ▶ Bridge large distances between axes
- ▶ Can be mounted radially by split clamping hub
- ▶ Mounting and dismounting without shifting the aligned axes
- ▶ Backlash-free and torsionally stiff

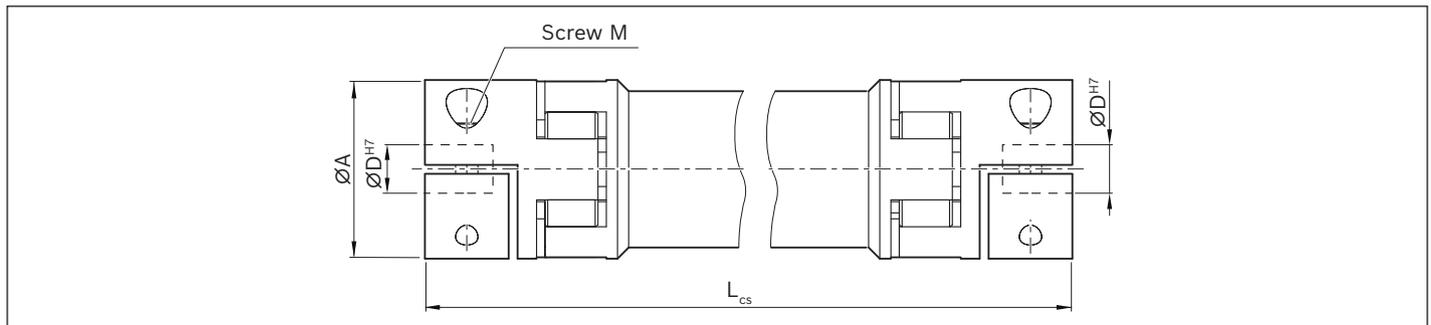

### CKR-070

#### Material

Coupling hub: high-strength aluminum

Elastomer circle: precision manufactured, extremely wear resistant, and thermally stable plastic

Connecting tube: high-precision aluminum tube

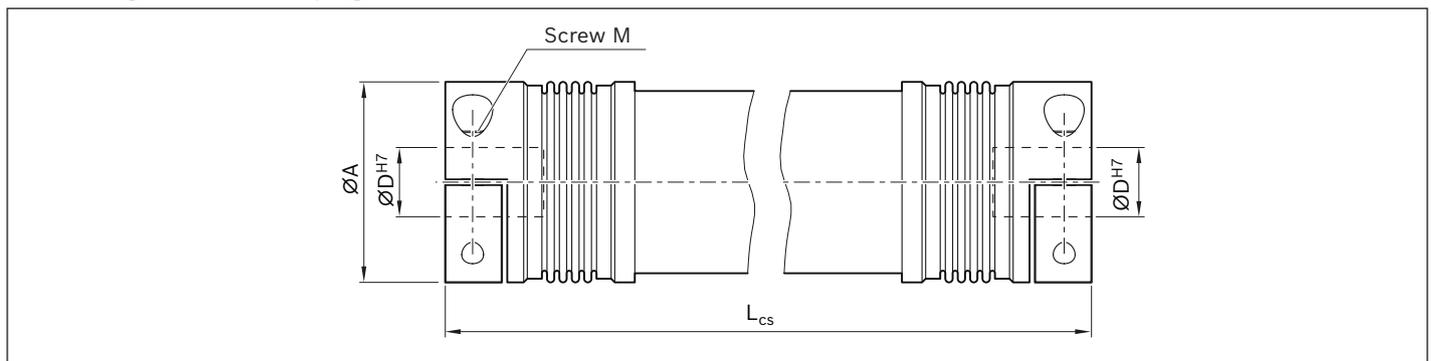

### CKR-090, -110, -145, -200

#### Material

Bellows: highly flexible stainless steel

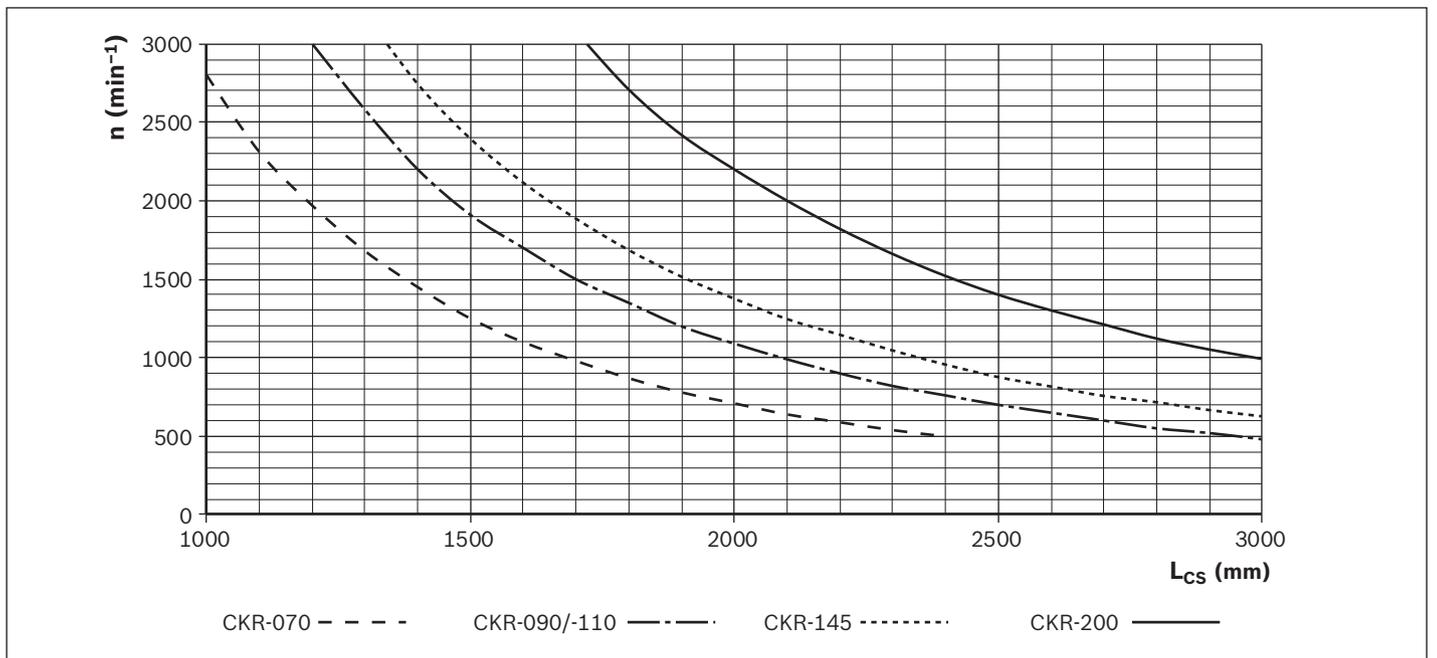

Connecting tube and clamping hub: Aluminum

**Bending-critical speed**

**Order**

Please state the material number and length L<sub>CS</sub>.  
e.g.: R0391 510 20, L<sub>CS</sub> = 550 mm

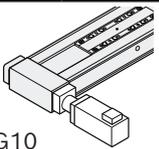

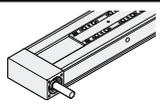

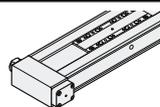

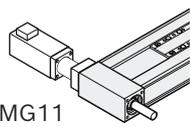

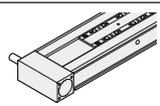

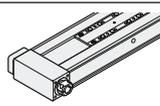

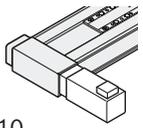

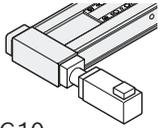

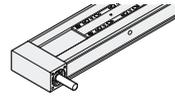

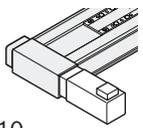

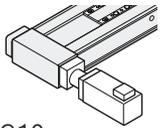

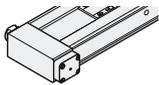

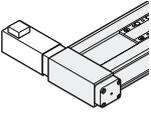

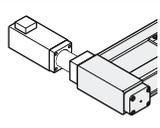

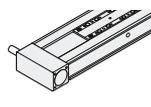

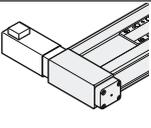

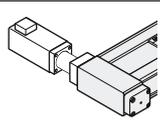

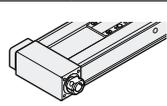

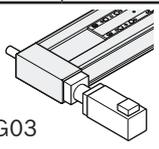

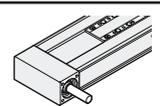

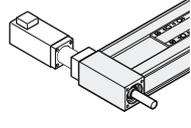

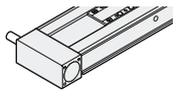

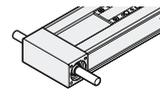

$$L_{CS} = D_{SS} + L_B$$

$$D_{SS} = L_M - L_1 - L_2$$

L<sub>1</sub>/L<sub>2</sub>: For the calculation, refer to the dimension drawings

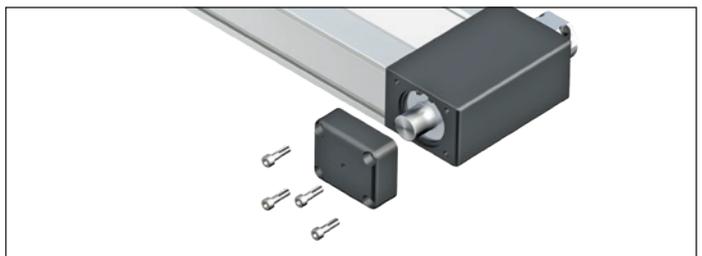

- D<sub>SS</sub> = Distance drive journals
- L<sub>CS</sub> = Overall length of the connecting shaft
- L<sub>M</sub> = Centerline-to-centerline distance between compact modules
- M<sub>A</sub> = Tightening torque of screws
- M<sub>CS</sub> = Rated torque of connecting shaft
- M<sub>S</sub> = Peak torque of connecting shaft
- n = Rotary speed (rpm)
- L<sub>CS</sub> = Overall length of the connecting shaft (mm)

**Combination possibilities for multi-axis systems with connecting shaft**

Size	Version

**Drive end enclosure with additional drive journal**

In the versions MA05, MA06, MA10, MA11, MG10 and MG11, a second drive journal can be made available by removing the screws and cover.

**Cover**

By attaching the cover, the open end of the drive (clamping hub) is closed.  
This means there is no longer any risk of injury from the rotating motor holder.

**Nozzle pipe**

For manual grease guns. For the lubrication of funnel-type and ball-type lube nipples.

Scope of delivery:

Nozzle pipe, interchangeable insert A for funnel-type lube nipple, interchangeable insert B for ball-type lube nipple.

Material number	Mass (g)
R345503106	158

**Frequency meter**

for checking the toothed belt pretension on linear axes with a toothed belt drive as well as the adjustment of the toothed belt pretension when driven via a belt side drive.

The compact IGAT measuring device TECO-PRO enables easy measurement of the pretension of standard belt systems. Equipped with the latest microprocessor technology, the measuring device enables precise adjustment of all V-belts, toothed belts and power belts that need to be tensioned in the measuring range between 10 and 600 Hz. Belt construction, color and material of the belt as well as the influence of light have no effect on the measurement result because the acoustic principle is used.

Scope of delivery:

The device is delivered with a permanently installed gooseneck. A leather belt bag is included. The device is delivered with a USB charging cable and a euro plug in a sturdy hard box.

## Motors

### Motor attachment kits according to customer spec.

The motor of linear motion systems with ball screw assembly is attached by either an attachment kit with flange and coupling (MF) or a belt side drive (RV).

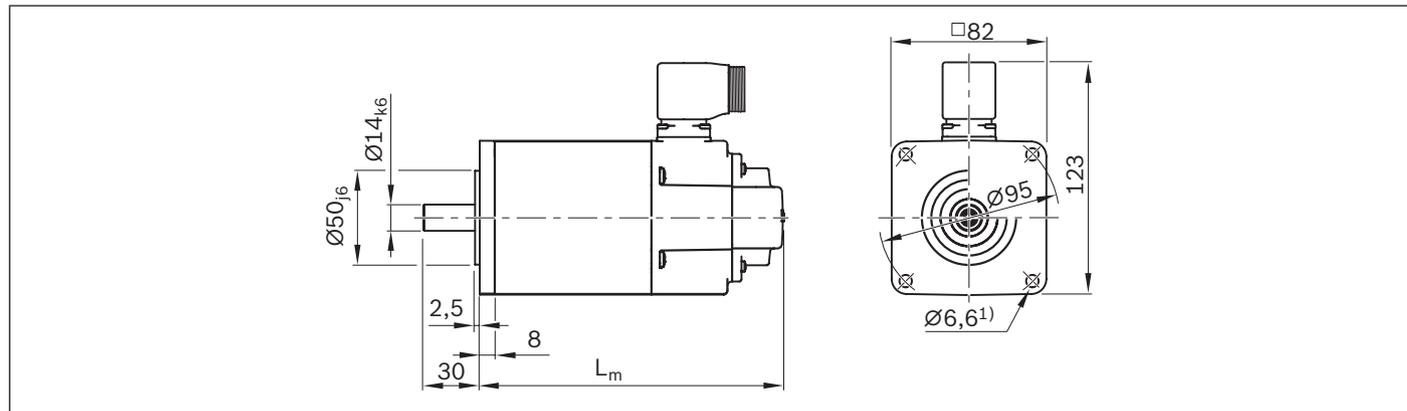

The available combinations are shown in the "Configuration and ordering" selection tables for each size. In addition to attachment kits for Rexroth motors, attachment kits for motors according to customer specification are also available. In order to determine the appropriate attachment kit, the connection geometry of the motor is crucial. Characteristics required to clearly determine motor geometry are shown below.

The dimensions queried result in a unique "motor geometry code":

	□□	-	□□	-	□□□□	-	□□□□	-	□□□□	-	M	□□	-	□□□□	-	□□□□
$\text{ØD}$	=	Shaft diameter														
$C$	=	Shaft length														
$\text{ØE}$	=	Centering diameter														
$C_1$	=	Centering depth														
$\text{ØF}$	=	Pitch diameter														
$\text{ØG}$	=	Drill hole for fastening screw (specify thread diameter)														
$B_1$	=	Flange thickness														
$A$	=	Flange edge dimension														

### Example illustration of servo motor IndraDyn S type MS2N04

1 4 - 3 0 - 0 5 0 - 2 . 5 - 0 9 5 - M 0 6 - 0 0 8 - 0 8 2

<sup>1)</sup> The drill hole  $\text{Ø} 6.6$  mm results in the type designation M06 for the geometry motor code (nominal thread diameter fastening screw M6).

Motor attachment kits for motors according to customer specification can be configured using the online configurator in the eShop. To do this, select the "Attachment kits for motors according to customer specification" option. Enter motor geometry in the input dialog box. The dimensions can be entered directly or by using a drop-down menu.

## Motor/controller combinations

Several motor-controller combinations are available in order to provide the most cost-effective solution for every customer application. When dimensioning the drive, always consider the motor-controller combination.

For more information on motors, controllers and control systems, please refer to the Rexroth automation solutions

➡ Chapter "Further information".

### IndraDrive drive family

The converters of the IndraDrive C series generate a DC link direct voltage from the grid supply voltage and from it a controlled AC output voltage with variable amplitude and frequency for operation of a servo motor.

The compact format contains additional mains connection components, making it particularly suitable for single-axis applications.

#### Version

- ▶ Basic Universal or Basic Universal with Safe Motion
- ▶ Multi-Ethernet for communication with a superior controller
- ▶ More interfaces or integrated controls available
- ▶ For the converter HCS01, a smart function kit for pressing and joining applications is available
- ▶ Brake resistor included
- ▶ Adapters included
- ▶ Separate mains filter included

IndraDrive Cs  
HCS01.1E-W0054

IndraDrive C  
HCS03.1E-W0100

### ctrlX drive family

With ctrlX DRIVE, Bosch Rexroth has developed the most compact, modular drive system worldwide for their customers. In addition to space-saving dimensions and maximum scalability, an almost unlimited number of combination options for the user, mature engineering tools and high energy efficiency are among the advantages of ctrlX DRIVE. The Bosch Rexroth servo motors are the perfect team players in the ctrlX DRIVE portfolio.

With compact dimensions, they combine highest dynamics with maximum accuracy for the position, rotary speed and torque values.

- ▶ EtherCAT SOE with Safe Torque Off or EtherCAT SOE with safe field bus
- ▶ Multi-Ethernet for communication with a superior controller
- ▶ More interfaces or integrated controls available
- ▶ Adapters included
- ▶ Separate mains filter included

ctrlX Drive (XCS)

### Description / options

1	Product	1: X = ctrlX DRIVE / 2: C = converter, feed-in / 3: S = single axis / 4: 2 = generation 2; 1 = generation 1
2	Cooling type	W = air, internal
3	Maximum current	0100 = 100 A (example) / 23, 54, 70, 100 ...
4	Protection class	A = IP20, 3 x AC 200...500 V
5	Power unit options	B = Brake transistor (XCS ≥ W0100) / R = Brake transistor/brake resistor integrated (XCS ≤ W0070)
6	Connector set	N = Without motor connector set
7	Control component	01 = ctrlX DRIVE / 02 = ctrlX DRIVEplus
8	Panel	N = Without panel / A = With panel
9	Communication	ET = Multi-Ethernet (RJ45) / X3 = ctrlX Core
10	Hardware option 1	T0 = Safe Torque Off (STO) / M5 = SafeMotion (M5)
11	Hardware option 2	EC = Multi-encoder interface / NN = Not equipped
12	Hardware option 3	ET = Multi-Ethernet / DA = I/O extension digital/analog / NN = Not equipped
13	Runtime type	S = Standard
14	Runtime version	02 = Version 02 (XCS1) / 03 = Version 03 (XCS2)
15	Runtime release	RS = Current release
16	Subject to export approval	N = No (maximum output frequency < 599 Hz)
17	Protocol - communication	0 = Defined via ctrlX CORE apps (XCS2) 1 = Sercos III / 2 = EtherCAT (SoE) / 4 = PROFINET IO
18	Technology function	NNN = None TF1 = Install technology apps (XCS2) TE1 = Install/program technology apps (XCS2) TX1 = Install/program technology apps incl. LIBs (Bosch Rexroth libraries) (XCS2)
19	Range of functions RT	N = DRIVE Runtime P = DRIVE Runtime Productivity
20	Range of functions SafeMotion	0 = Hardware option / 1 ≠ SafeMotion 3 = SafeMotion Speed / 5 = SafeMotion Position
21	Other Version	NN = No

## Switching system

### Socket-connector

Notes:

The socket and connector are not pre-wired.

This allows optimal assignment of switch activation points during commissioning.

One connector is included.

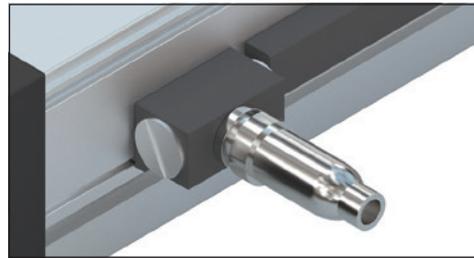

The connector can be mounted in three directions.

For further information, see the section "Socket-connector".

#### Socket-connector

Compact module	Material number
CKK/CKR: 070	R117560102
CKK/CKR: 090, 110, 145	R037540000

#### Socket-connector

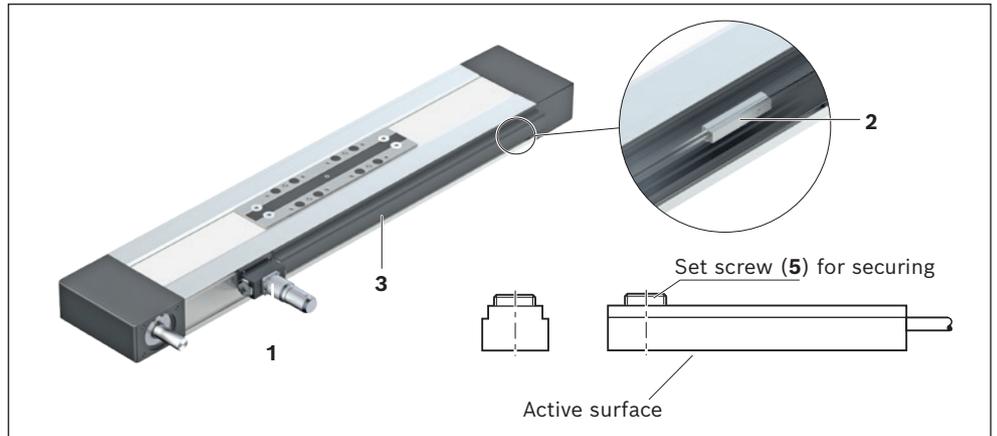

Compact module	Material number
CKK/CKR: 200	R037540000

**Overview of attachment variants**

**Magnetic sensor with free cable end**

- 1 Socket and connector
- 2 Sensor
- 3 Cable duct

Alternatively, the sensor can also be fastened by switch mounting plate and cable holder. See the magnetic sensor with connector.

**Attachment/actuation**

A cable duct is needed to fasten the sensors and for cable routing. This is suspended at the side in a slot at the compact module and fastened with set screws (4).

The set screws are included.

The sensors are pushed into the upper T-slot (CKK/CKR-090,-110 and CKK-145)

or into the lower T-slot (CKR-145, CKK/CKR-200) of the cable duct and secured with set screws (5).

Switch activation is done by magnets in the carriage.

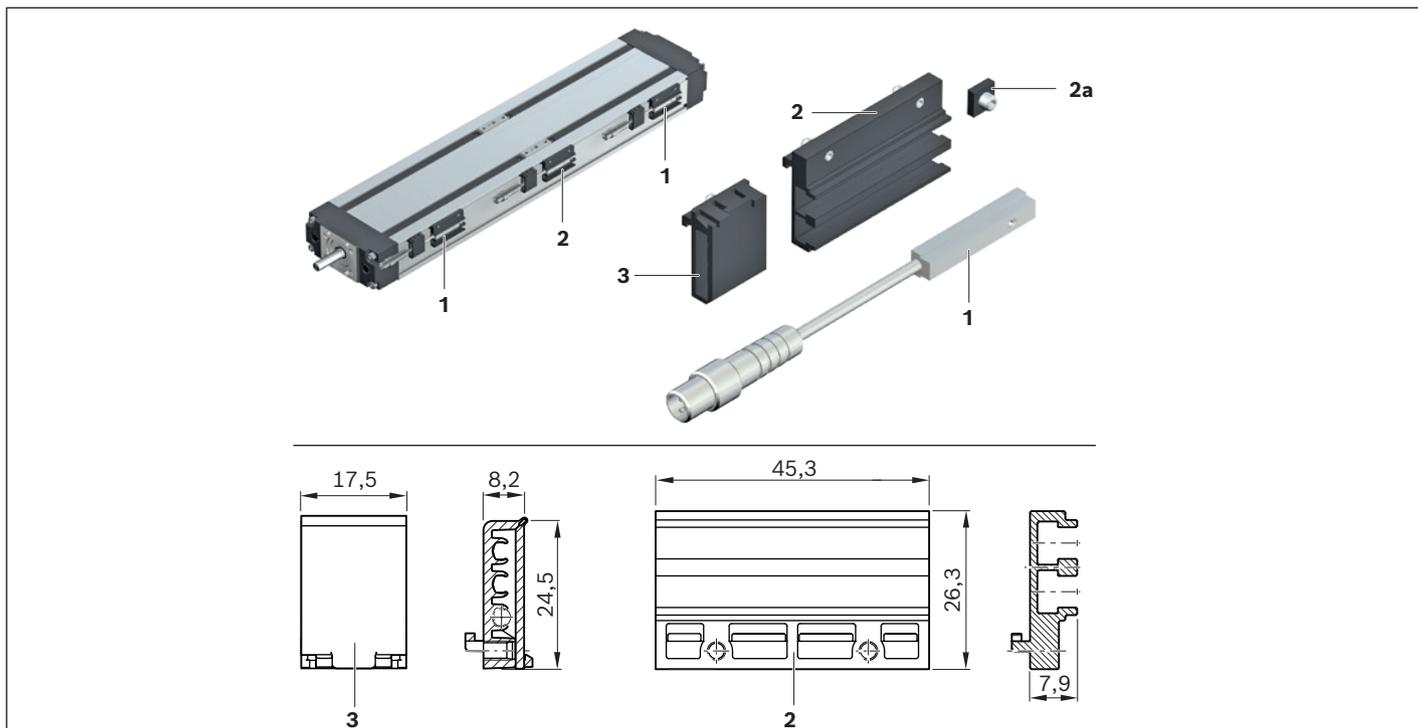

CKK/CKR-070	CKK/CKR-090 CKK/CKR-110 CKK-145	CKR-145	CKK/CKR-200

Cable duct		
Compact module	Material number	Length calculation
CKK/CKR: 070	R039662026	$L_K = L - 5$
CKK: 090, 110, 145, 200	R039662018	$L_K = L - 5$
CKR: 090, 110, 145, 200	R039662018	$L_K = L - 10$

$L_K$  = Length of the cable duct (mm)  
 $L$  = Length of the linear motion system (mm)

**Magnetic sensor with connector**

- 1 Sensor (Material number see chapter sensors and accessories)
- 2 Switch mounting plate including set screws (loose) and square nut (2a) (Material number R037530021)
- 3 Cable holder including set screw (loose) (Material number R037530022)

**Attachment/actuation**

A switch mounting plate (2) is required to fasten the sensors. This is suspended in the slot on the compact module and fastened with set screws (4). The sensors are pushed into the respective slot on the switch mounting plate and secured with one set screw. The square nut with set screw (2a) serves as a positive stop for the sensor (switch activation point when changing sensors). Parts are included in the scope of delivery of the sensor mounting kit. Switch activation is done by magnets in the carriage.

CKK/CKR-070	CKK/CKR-090, -110, CKK-145	CKR-145	CKK/CKR-200

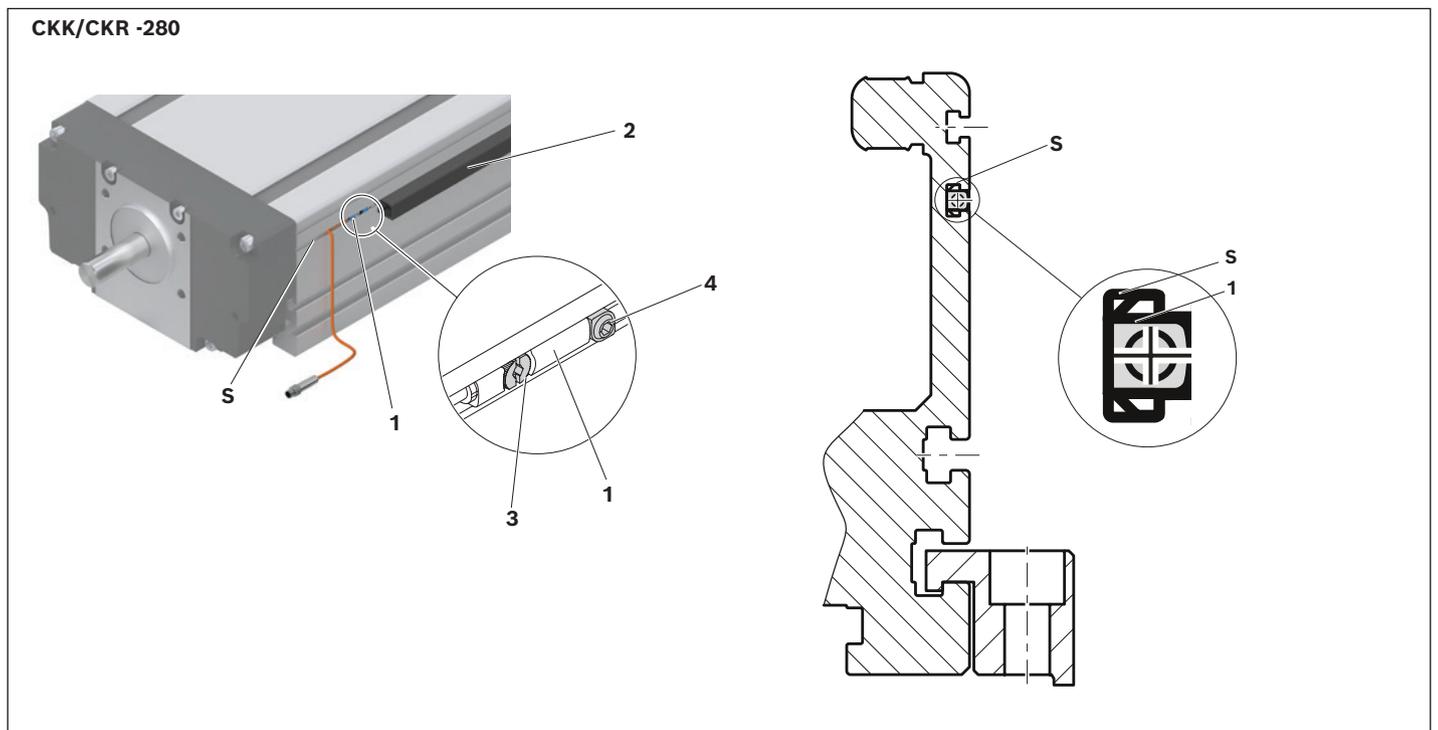

**Magnetic sensor with connector (only for CKK/CKR -280)**

- 1 Sensor (Material number see chapter sensors and accessories)
- 2 Cable duct  $L_K = XX$  mm (R039662017)
- 3 Clamping screw
- 4 Sliding block (R117509008)

The switch activator is a magnet (on both sides) that is integrated in the carriage (no switching cam necessary). The switch activation points can be positioned anywhere along the stroke.

**Attachment/actuation**

The magnetic sensor is positioned in the corresponding sensor slot (S) and fixed by turning the clamping screw (3). The sliding block (4) is not necessarily required for mounting, it is only required for repeatable mounting of the sensor.

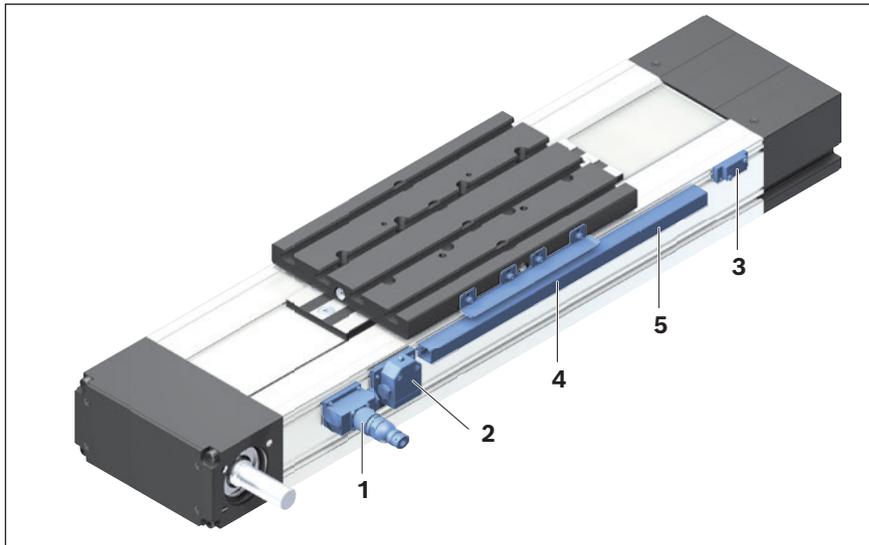

**Inductive sensors and mechanical switches for CKK/CKR-200**

- 1 Socket and connector
- 2 Mechanical switch (with attachments)
- 3 Inductive sensor (with attachments)
- 4 Switching cam (attachment only at the connection plate)
- 5 Cable duct

Alternatively, the connection line of the switches can also be fastened by cable holder.

See "Switching system".

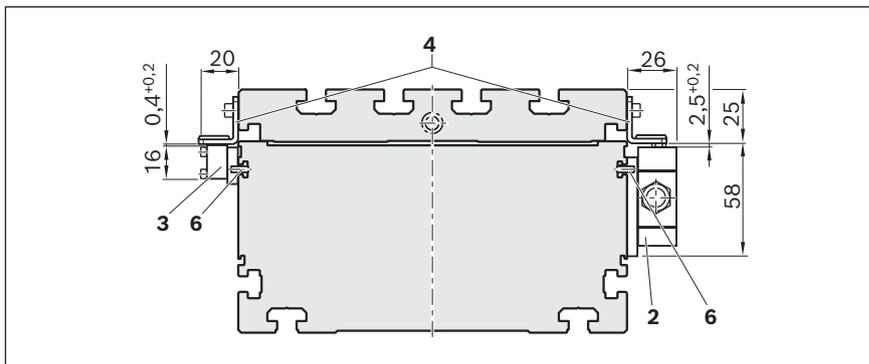

**Attachment/actuation**

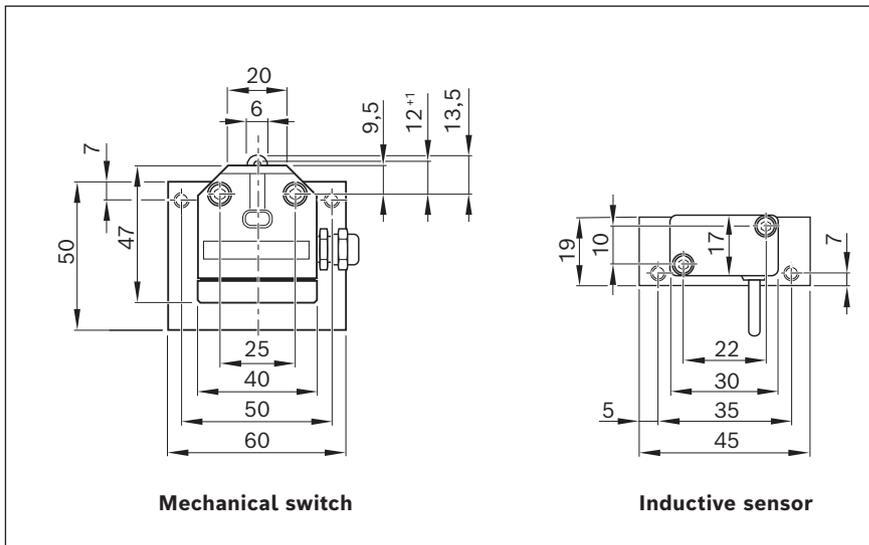

The switches are suspended in the upper slot on the compact module and fastened with set screws (6).

The actuation is done using switching cams (4). This is fastened with the screws to the connection plate.

Fastening screws are included.

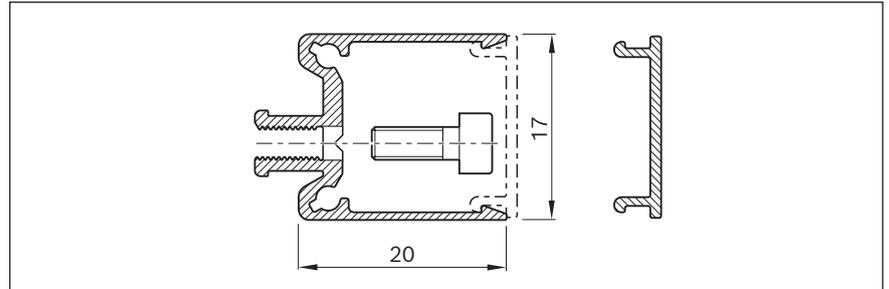

**Switch with attachment**

**Cable duct**

The cable duct is fastened in the lateral slots of the frame. Fastening screws widen the profile and ensure that the cable duct is securely mounted.

The cable duct will accommodate up to two cables for mechanical switches and three cables for proximity switches. Fastening screws are included.

**Cable duct**

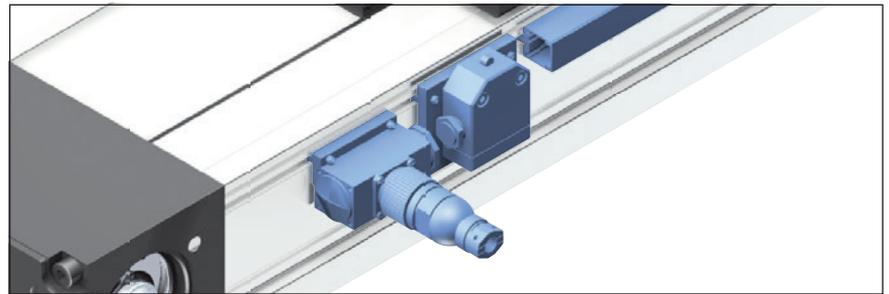

Compact module	Length calculation
<b>CKK 200</b>	$L_K = L - 5$
<b>CKR 200</b>	$L_K = L - 10$

$L_K$  = Length of the fastening and the cable duct (mm)  
 $L$  = Length of the linear motion system (mm)

**Socket-connector**

Notes:

The socket and connector are not pre-wired. This allows optimal assignment of switch activation points during commissioning. One connector is included. The connector can be mounted in three directions.

## Service and information

### Operating conditions

#### Normal operating conditions

Ambient temperature with Bosch Rexroth servo motor	0 °C ... 40 °C, loss of performance above 40 °C
Ambient temperature for mechanical system (no undershooting the dew point)	-10 °C ... 60 °C
Travel range $s_{\min}$ <sup>1)</sup>	See the CKK/CKR "technical data" table
Soiling	Not permissible

<sup>1)</sup> Minimum travel range to ensure a reliable lubrication distribution.

#### Required and supplementary documentation

For further instructions and information, please refer to the documentation for this product.

You can find PDF files of these documents on the Internet at [www.boschrexroth.com/mediadirectory](http://www.boschrexroth.com/mediadirectory).

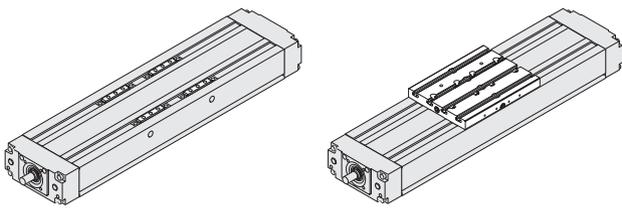

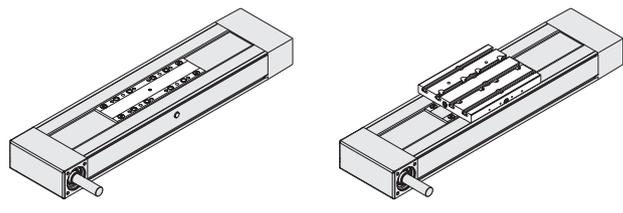

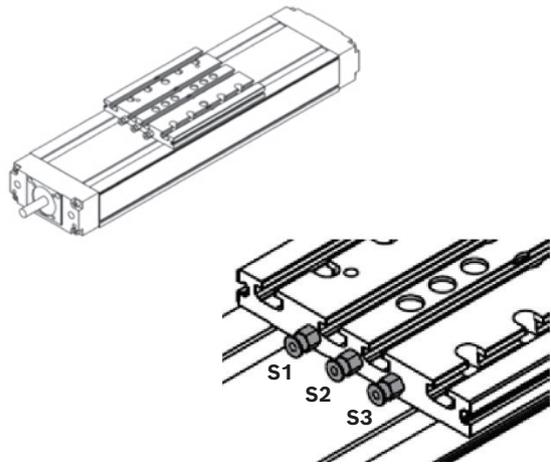

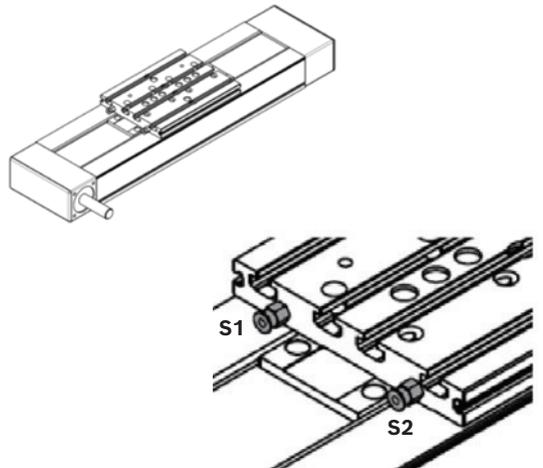

We would also be happy to send you the documents that you want.

If you are unsure about using this product, please contact Bosch Rexroth.

# Lubrication

The profiled rail system and the ball screw assembly must be lubricated (compact modules CKK). The basic lubrication of all other components, e.g. deep-groove ball bearings, cover strips, gear units, etc. is done by the manufacturer.

## Overview of lubrication versions

<p style="text-align: center;"><b>Compact modules CKK</b> Lubrication version LSS, LPG</p> <ul style="list-style-type: none"> <li>▶ Grease lubrication using manual grease gun via             <ul style="list-style-type: none"> <li>- Frame</li> <li>- Carriage</li> <li>- Connection plate</li> </ul> </li> </ul>  <p style="text-align: center;">with connection plate</p>	<p style="text-align: center;"><b>Compact modules CKR</b> Lubrication version LSS, LPG</p> <ul style="list-style-type: none"> <li>▶ Grease lubrication using manual grease gun via             <ul style="list-style-type: none"> <li>- Frame</li> <li>- Carriage</li> <li>- Connection plate</li> </ul> </li> </ul>  <p style="text-align: center;">with connection plate</p>

### Notes on lubrication

- ▶ Follow the product instructions.
- ▶ Do not use lubricants with solid particles (e.g. graphite or MoS<sub>2</sub>).
- ▶ If you use different lubricants than the ones specified, relubrication intervals may be shorter and performance may decrease with short stroke and load ratio; in addition, chemical interactions can take place between the plastics, lubricants and preservative agents. Single-line central lubrication systems also need to be able to pump these lubricants.
- ▶ If using a central lubrication system, make sure all lines and elements are filled with lubricant all the way to the connection to the consumer (carriage) and that there are no air bubbles.
- ▶ Lubricant reservoirs should contain an agitator to ensure the lubricant can flow (avoids hardening in the reservoir).
- ▶ For relubrication, it is not possible to switch from grease to oil lubrication and vice-versa.
- ▶ If environmental factors such as contamination, vibrations, impact loads, etc. are present, we recommend shorter relubrication intervals. Even under normal operating conditions, relubrication is required every two years due to grease aging.
- ▶ Rexroth recommends piston distributors by SKF. These should be installed as close to the carriage lube fittings as possible. Avoid long lines (no longer than 1 m) and narrow line diameters. Install the lines at a gradient.
- ▶ If other consumers are connected to the single-line lubrication system, the weakest link in this chain determines the lubrication cycle.
- ▶ Excess lubricant can accumulate inside of the compact module or flow out and may lead to contamination of the environment
- ▶ Never put a compact module into operation without basic lubrication.

**⚠ Use of lubricants with H1 approval:**

**Loss of H1 approval**

H1 lubricants or release agents (preservative agents) only have H1 approval if they are separated and unmixed (including at the lubrication point). A blend of two H1 approval lubricants or separating agents does not have H1 approval.

**No approval or authorization for use in the food industry**

Because of the use of H1 lubricants, the compact modules do not have authorization or approval for the food industry.

**Components lubricated at the factory**

Components lubricated by the manufacturer at the factory such as deep-groove ball bearings, cover strips, gears, etc. do not use H1 lubricants.

**⚠ Compact modules with Dynalub 520 (NLGI 00 consistency class) initial greasing must not be pre-lubricated with lubricants of NLGI 2 consistency class!**

For relubrication quantity and relubrication position ⇒ see Compact modules CKK / Compact modules CKR instructions.

**Relubrication interval**

When using the standard lubrication from the manufacturer:

Relubrication interval ⇒ see Compact modules CKK / Compact modules CKR instructions.

Use of Dynalub 520 (NLGI 00) instead of Dynalub 510 (NLGI 2):

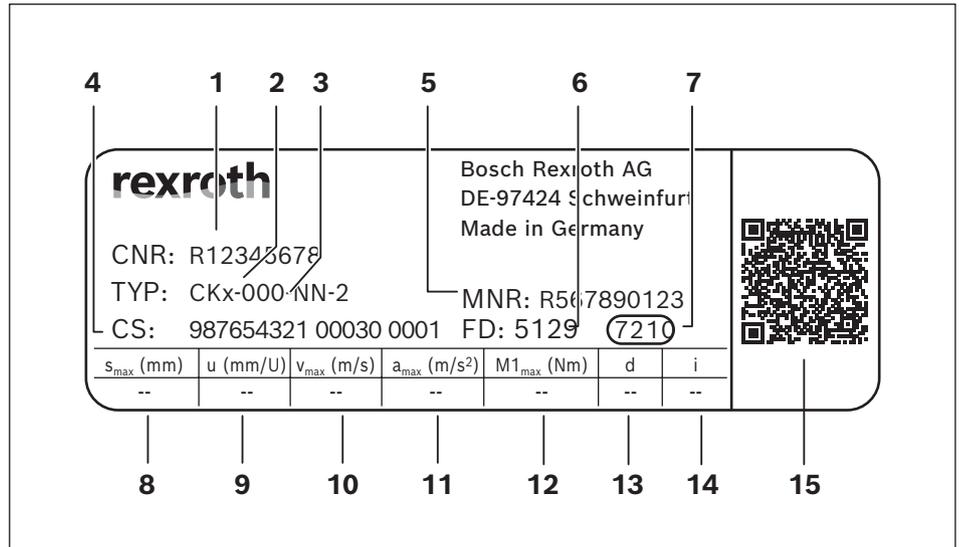

The relubrication interval is 75% of the standard relubrication interval ⇒ CKK/CKR instructions.

Use of lubricants with H1 approval:

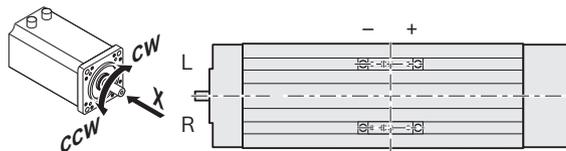

First relubrication takes place after 20 km. As a guideline value for relubrication intervals, 50% of the standard relubrication intervals must be applied ⇒ See Compact modules CKK / Compact modules CKR instructions.

## Parameterization (commissioning)

The nameplate contains reference information on the production of the linear motion system as well as technical commissioning parameters.

1	CNR	Customer's material number
2	TYP	Short product name
3	110	Size
4	CS	Customer information
5	MNR	Material number
6	FD	Date of manufacture
7	7210	Manufacturing location
8	$s_{max}$	Maximum travel range
9	$u$	Feed constant without motor attachment
10	$v_{max}$	Maximum speed
11	$a_{max}$	Maximum acceleration rate
12	$M1_{max}$	Maximum drive torque at motor journal
13	$d$	Direction of motor rotation to travel in positive (+) direction CW = Clockwise CCW = Counterclockwise

14	$i$	Gear ratio
15		QR code

Documentation

**Standard report**

**Option 001**

The standard report serves to confirm that the checks listed in the report have been carried out and that the measured values lie within the permissible tolerances.

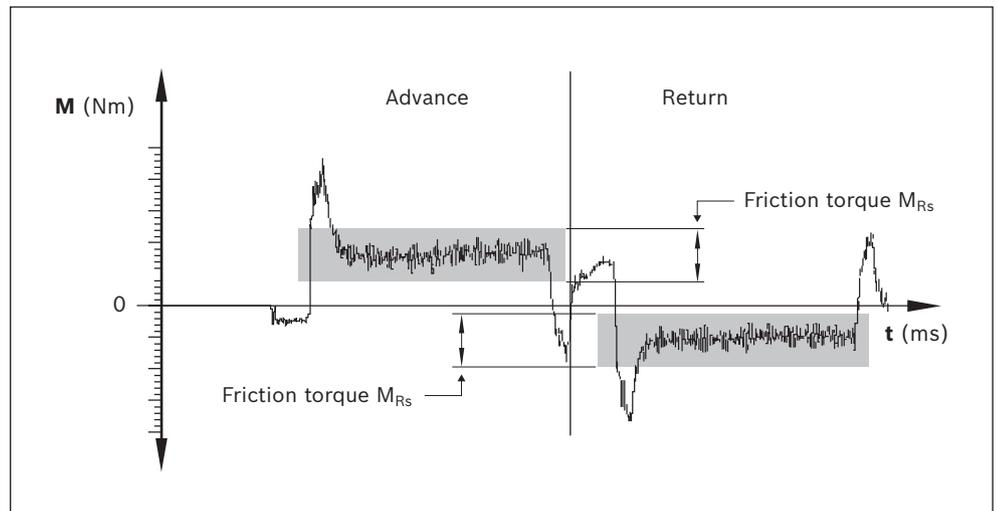

Checks listed in the standard report:

- ▶ Functional checks of mechanical components
- ▶ Functional checks of electrical components
- ▶ Design as per order confirmation

**Measurement of frictional torque of complete system**

**Option 002 (includes option 001)**

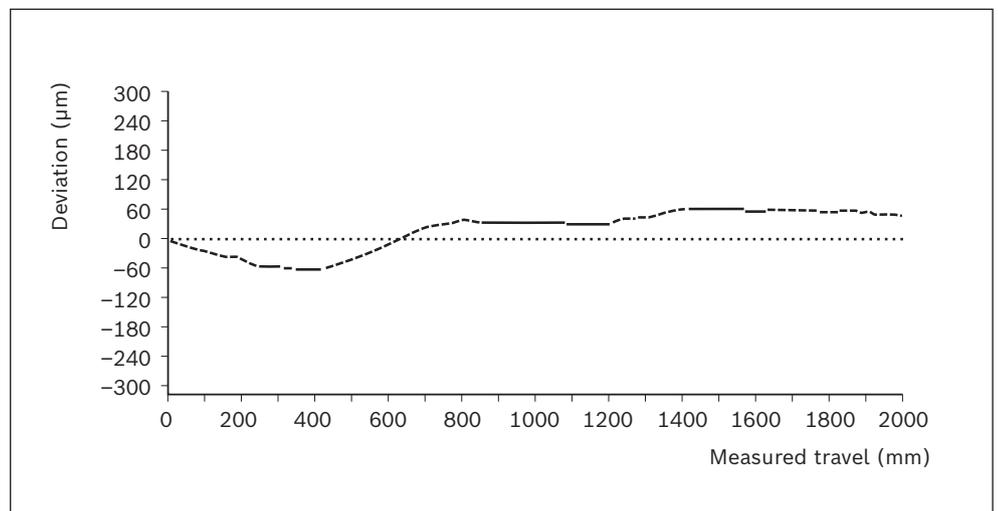

The friction torque is measured over the entire travel range.

**Lead deviation of the ball screw assembly with compact modules CKK**

**Option 003 (includes option 001)**

In addition to graphical representation (see illustration), a measurement report is supplied in table form.

### Length calculation of the linear motion system

For length calculation values, see chapter "Technical Data" of the relevant compact module (CKK/CKR)

$$L = s_{\text{eff}} + 2 \cdot s_e + L_{\text{ca}} + L_{\text{ad}}$$

### Effective stroke

$$s_{\text{eff}} = s_{\text{max}} - 2 \cdot s_e$$

Stroke: maximum distance from carriage center to the outer-most switch activation points.

Excess travel: Excess travel must be greater than braking distance. The acceleration travel can be adopted as the guideline value for the braking distance.

### Mass of the linear motion system

Weight calculation:

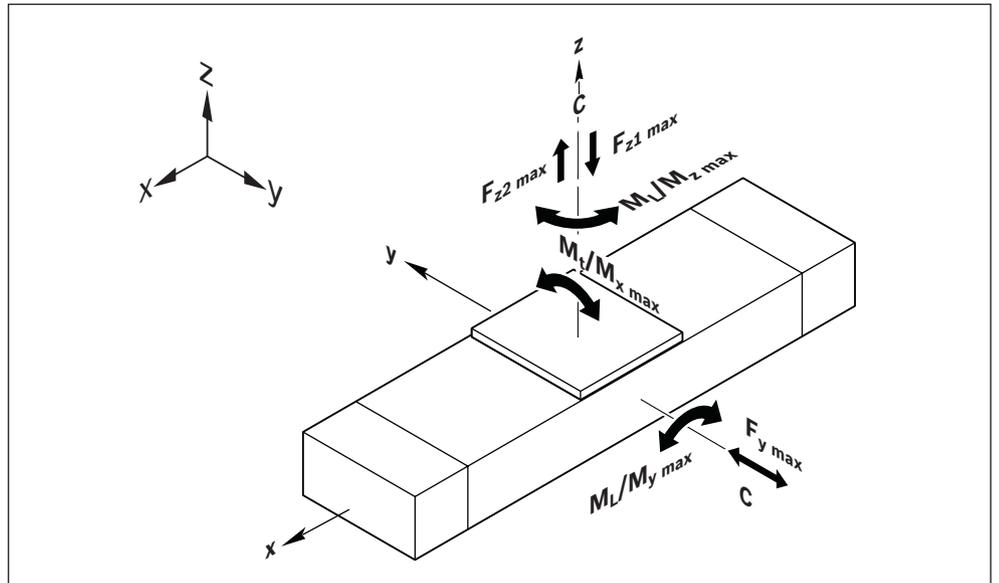

- ▶ without motor
- ▶ without switch mounting
- ▶ without motor attachment

$$m_s = k_{g \text{ fix}} + k_{g \text{ var}} \cdot L + m_{\text{ca}}$$

**Note on dynamic load capacities and moments**

Determination of the dynamic load capacities and moments is based on a total travel of 100,000 m. Often only 50,000 m of total travel are actually stipulated. For comparison: Multiply values  $C$ ,  $M_t$  and  $M_L$  by a factor of 1.26.

**Suitable loads**

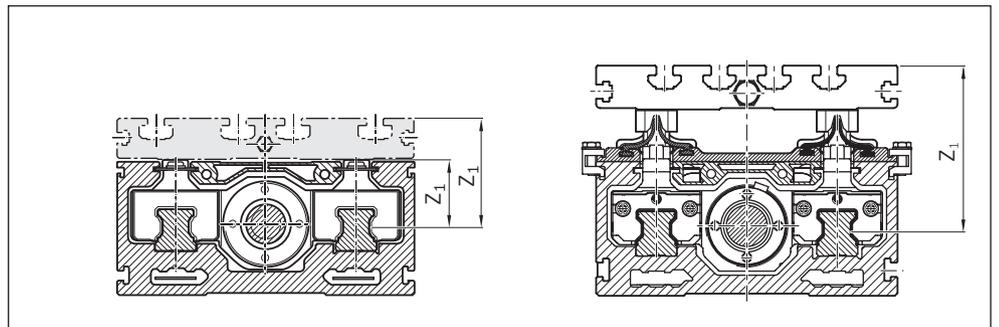

Regarding the desired service life, general loads for  $F_{mgw}$ ,  $F_{mbs}$  should not exceed around 20% of the dynamic characteristic values ( $C_{gw}$ ,  $C_{bs}$ ).

See "Project planning" chapter.

Do not exceed the technical data for the linear motion system.

**Application point of the effective force ( $Z_1$ )**

**Modulus of elasticity E**

$E = 70,000 \text{ N/mm}^2$

### Maximum permissible load

When selecting linear motion systems, it is essential to consider the maximum permissible load and force tolerances according to the table. The values depend on the system. In other words, the tolerances are determined not only by the load capacities of the bearing points but are also based on design and material.

Conditions for combined loads:

$$\frac{|F_y|}{F_{y \max}} + \frac{|F_z|}{F_{z \max}} + \frac{|M_x|}{M_{x \max}} + \frac{|M_y|}{M_{y \max}} + \frac{|M_z|}{M_{z \max}} \leq 1$$

### Life expectancy calculation of the linear guide

The service life of the rolling bearing points contained in a linear motion system can be calculated using the formulas given below. The roller bearing points that determine the life of a linear motion system with ball screw assembly are the linear guide, the ball screw assembly (nut) and the fixed bearing. The linear guide in the linear motion system must withstand the load as well as any process forces that occur.

**⚠ The calculated service life specification for the linear motion system is determined by the shortest of the separately determined service life values for linear guide, ball screw assembly or fixed bearing.**

Where the operating conditions vary (speed and load), the service life must be calculated using the average values  $v_{mgw}$  and  $F_{mgw}$ .

Nominal service life in meters:

$$L_{gw} = \left( \frac{C_{gw}}{F_{mgw}} \right)^3 \cdot 10^5$$

Nominal service life in hours:

$$L_{hgw} = \frac{L_{gw}}{3600 \cdot v_{mgw}}$$

Dynamically equivalent load on bearing of the guideway:

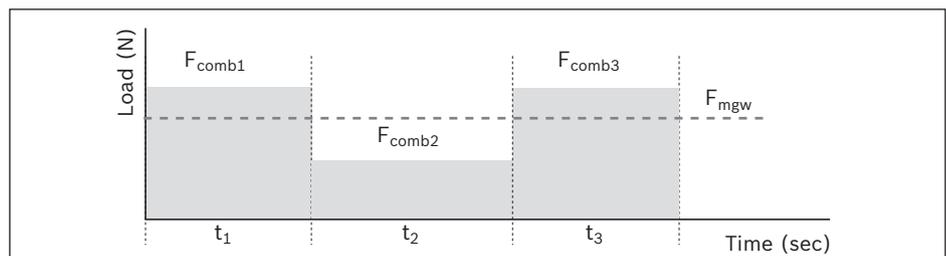

$$F_{mgw} = \sqrt[3]{|F_{eff1}|^3 \cdot \frac{q_{t1}}{100\%} + |F_{eff2}|^3 \cdot \frac{q_{t2}}{100\%} + |F_{eff3}|^3 \cdot \frac{q_{t3}}{100\%} + |F_{effn}|^3 \cdot \frac{q_{tn}}{100\%}}$$

The following applies to linear motion systems:

$$F_{eff} = F_{comb}$$

Combined equivalent bearing load:

$$F_{comb} = |F_y| + |F_z| + C_{gw} \cdot \frac{|M_x|}{M_t} + C_{gw} \cdot \frac{|M_y|}{M_L} + C_{gw} \cdot \frac{|M_z|}{M_L}$$

Average linear speed of the guideway:

$$v_{mgw} = \frac{|v_1| \cdot q_{t1} + |v_2| \cdot q_{t2} + \dots + |v_n| \cdot q_{tn}}{100\%}$$

**Service life of ball screw assembly or fixed bearing**

Where the operating conditions vary (rotary speed and load), the service life must be calculated using the average values  $F_{mbs}$  and  $n_m$ .

Nominal service life in revolutions:

$$L_{bs} = \left( \frac{C_{bs}}{F_{mbs}} \right)^3 \cdot 10^6$$

Nominal service life in hours:

$$L_{hbs} = \frac{L_{bs}}{60 \cdot n_m}$$

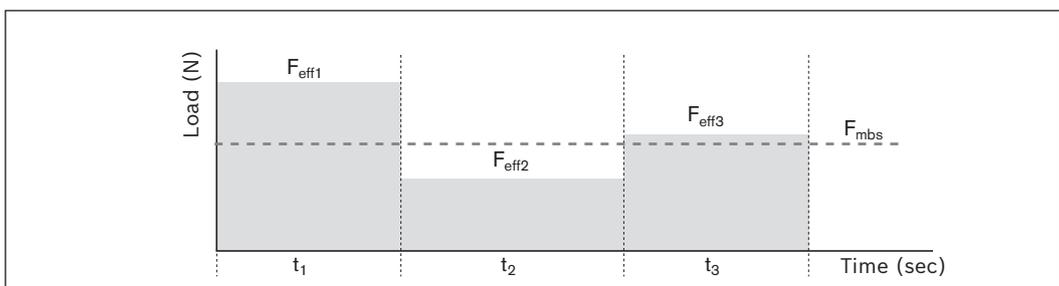

Dynamically equivalent load on bearing of the ball screw assembly:

$$F_{mbs} = \sqrt[3]{|F_{eff1}|^3 \cdot \frac{|n_1|}{n_m} \cdot \frac{q_{t1}}{100\%} + |F_{eff2}|^3 \cdot \frac{|n_2|}{n_m} \cdot \frac{q_{t2}}{100\%} + |F_{eff3}|^3 \cdot \frac{|n_3|}{n_m} \cdot \frac{q_{t3}}{100\%} + \dots + |F_{effn}|^3 \cdot \frac{|n_n|}{n_m} \cdot \frac{q_{tn}}{100\%}}$$

The following applies to the axial load  $F_n$  for linear motion systems:

$$F_{eff} = |F_n|$$

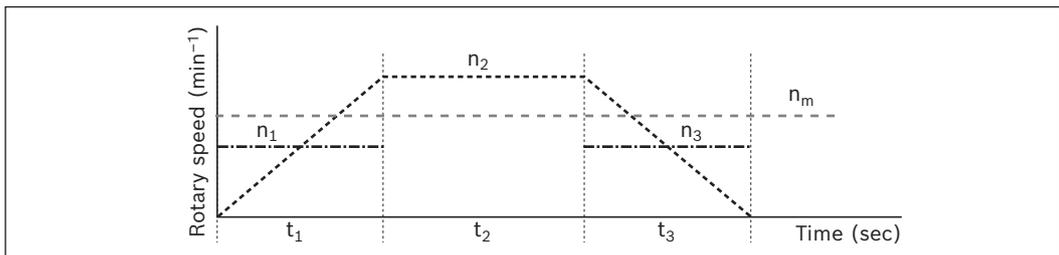

When both the load and the rotary speed vary, the average load  $F_{mbs}$  is calculated as follows:

Average rotary speed of the screw:

$$n_m = \frac{|n_1| \cdot q_{t1} + |n_2| \cdot q_{t2} + \dots + |n_n| \cdot q_{tn}}{100\%} = \frac{v_{mgw} \cdot 60\,000}{P}$$

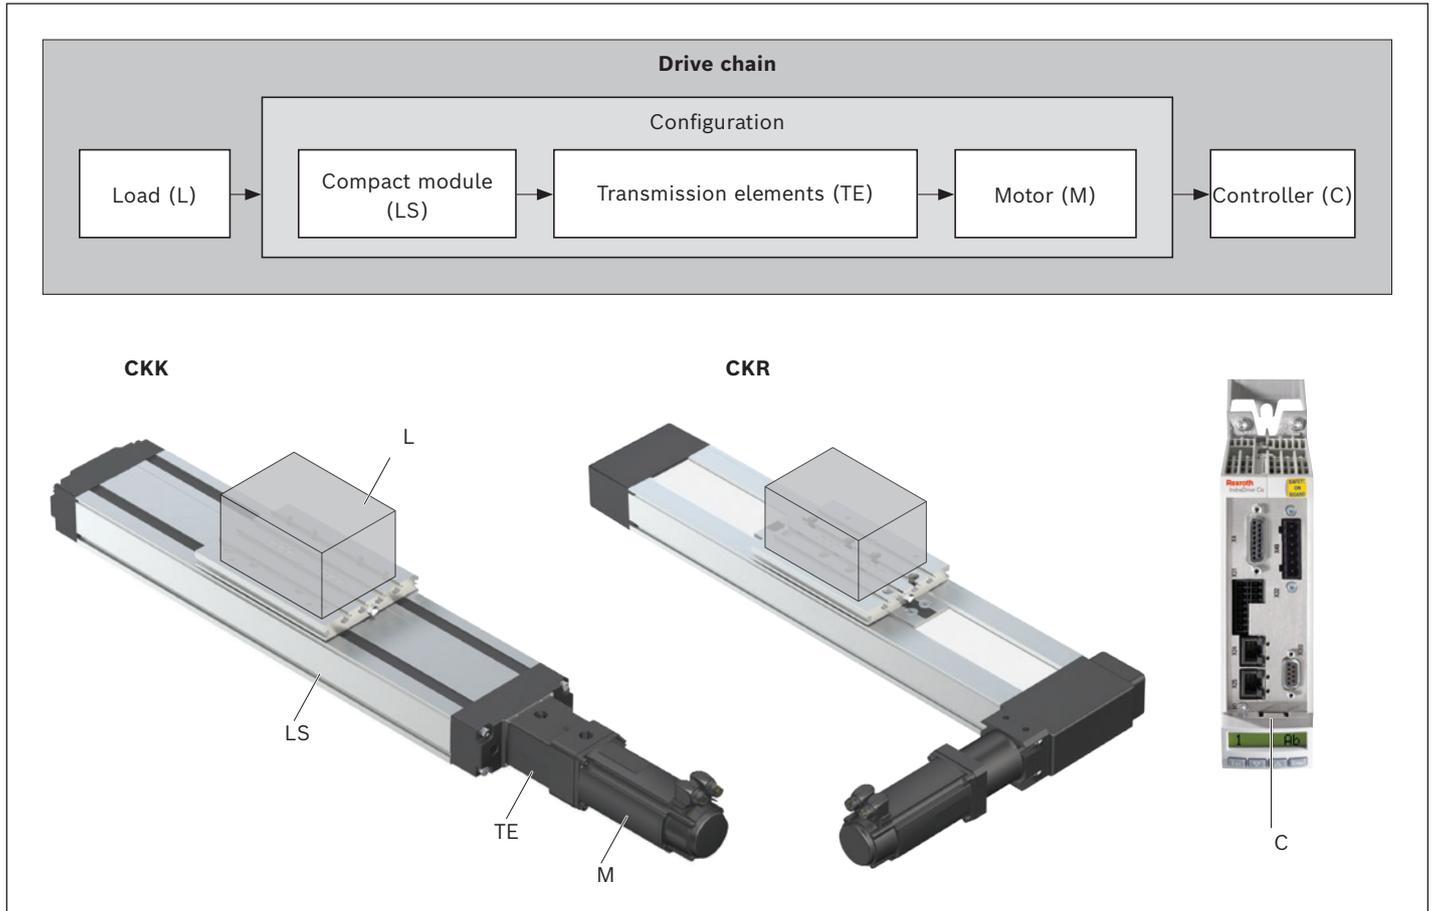

If rotary speed varies, average rotary speed  $n_m$  is calculated as follows:

Rotary speed in acceleration and braking phases  $n_{1 \dots n}$ :

$$n_{1 \dots n} = \frac{n_{A1 \dots n} + n_{E1 \dots n}}{2}$$

## Drive sizing

The correct dimensioning and assessment of an application requires structured consideration of the drive chain as a whole.

The basic element of the drive chain is the configuration – made up of the linear motion system, the transmission element (coupling, belt side drive or gear unit) and the motor – which can be ordered in that constellation in the catalog.

**Basic principles**

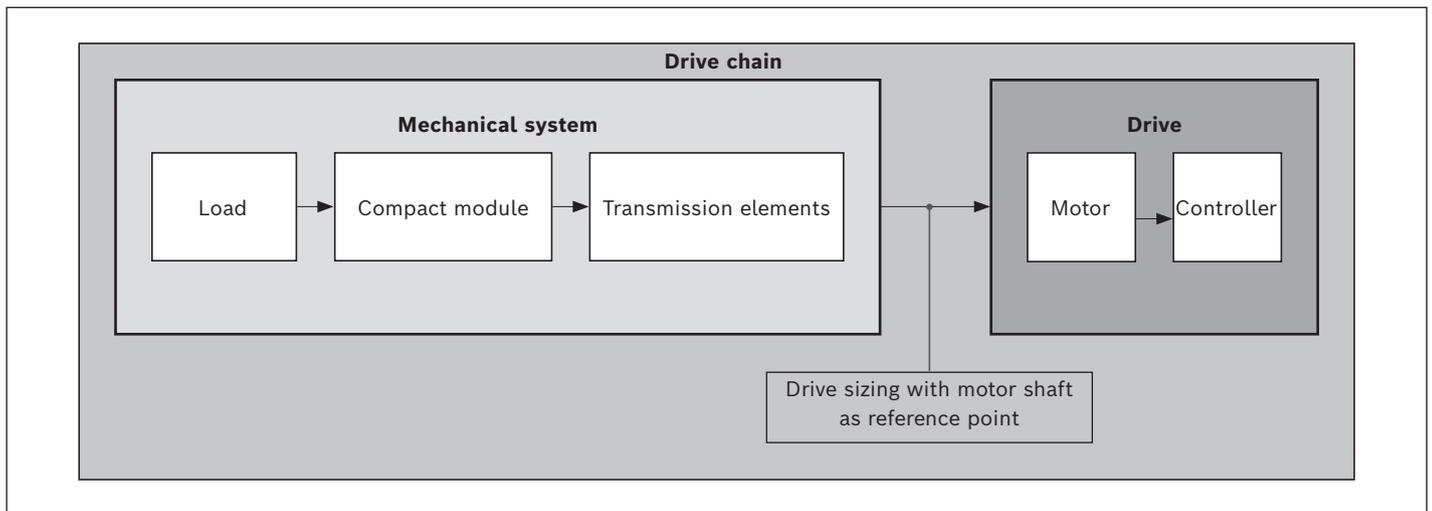

For drive sizing, the drive chain can be divided into mechanical system and drive system.

The **mechanical** system includes the physical components – linear motion system and the transmission elements (belt side drive, coupling) – and the load to be carried.

The electric **drive** is a motor-controller combination with corresponding performance data.

The sizing and/or dimensioning of the electric drive is done taking the motor shaft as a reference point.

For drive sizing, limits must be taken into account as well as base values. The limits must not be exceeded in order to avoid damaging the mechanical components.

**Technical data and formula symbols for the mechanical system**

For every component (linear motion system, coupling, belt side drive, gear unit), the corresponding maximum permissible limits for drive torque and speed, and the base values for friction torque and mass moment of inertia have to be used.

The following technical data with the associated formula symbols are used when considering the basic **mechanical** system requirements in the design calculations for sizing the drive. The data listed in the table below can be found in the chapter "Technical Data" or is determined using formulas based on the descriptions on the following pages.

	Mechanical system					
	Load	Linear motion system	Transmission element			
			Coupling	Belt side drive	Gearing	
<b>Weight moment</b>	(Nm)	$M_g^{5)}$	–	–	–	
<b>Friction torque</b>	(Nm)	– <sup>4)</sup>	$M_{Rs}^{3)}$	–	$M_{Rge}^{3)}$	
<b>Mass moment of inertia</b>	(kgm <sup>2</sup> )	$J_t^{1)}$	$J_s^{2)}$	$J_c^{3)}$	$J_{ge}^{3)}$	
<b>Max. permissible speed</b>	(m/s)	–	$v_{max}^{3)4)}$	–	–	
<b>Max. permissible rotary speed</b>	(rpm)	–	$n_p^{1)}$		$n_{ge}^{3)}$	
<b>Max. permissible drive torque</b>	(Nm)	–	$M_p^{3)4)}$	$M_{cN}^{3)}$	$M_{sd}^{3)}$	$M_{ge}^{3)}$

- 1) Determine the value using the appropriate formula
- 2) Length-dependent value, determined using the appropriate formula
- 3) Use the value from the table
- 4) CKK: Length-dependent value, to be read off the graph
- 5) Any additional process forces are to be taken into consideration as load moments
- 6) For vertical installation position: Determine the value using the appropriate formula

### Drive sizing with motor shaft as reference point

When sizing the drive, all relevant design calculation values for the mechanical components in the drive chain have to be determined and be expressed/reduced to the motor shaft. For a combination of mechanical components within the drive chain, this will result in one value for each of the following:

- ▶ Friction torque  $M_R$
- ▶ Mass moment of inertia  $J_{ex}$
- ▶ Max. permissible speed  $v_{mech}$  (maximum permissible rotary speed  $n_{mech}$ )
- ▶ Max. permissible drive torque  $M_{mech}$

### Determination of the values for each mechanical component in the drive chain based on the motor shaft as a reference point

Compact modules CKK	
<b>Friction torque <math>M_R</math></b>	
For motor attachment via flange and coupling	$M_R = M_{Rs}$
For motor attachment via belt side drive	$M_R = M_{Rsd} + \frac{M_{Rs}}{i}$
<b>Mass moment of inertia <math>J_{ex}</math></b>	
For motor attachment via flange and coupling	$J_{ex} = J_s + J_t + J_c$
For motor attachment via belt side drive	$J_{ex} = J_{sd} + \frac{(J_s + J_t)}{i^2}$

Compact modules CKR	
<b>Friction torque <math>M_R</math></b>	
For motor attachment via gear	$M_R = M_{Rge} + \frac{M_{Rs}}{i}$
<b>Mass moment of inertia <math>J_{ex}</math></b>	
For direct motor attachment (without gear)	$J_{ex} = J_s + J_t$
For motor attachment via gear	$J_{ex} = J_{ge} + \frac{(J_s + J_t)}{i^2}$

Mass moment of inertia of linear motion system	$J_s = (k_{J \text{ fix}} + k_{J \text{ var}} \cdot L) \cdot 10^{-6}$
--	---

Determination of translative mass moment of inertia of the external load	$J_t = m_{ex} \cdot k_{J m} \cdot 10^{-6}$
--	--

**Maximum permissible speed  $v_{\text{mech}}$  or maximum permissible rotary speed  $n_{\text{mech}}$**

The lowest of all the values for permissible speed or rotary speed of all mechanical components contained in the drive chain determines the maximum permissible speed of the mechanical system which has to be taken into consideration as the upper limit for the drive when sizing the motor.

Depending on the system, the maximum permissible speed/rotary speed of the linear motion system with ball screw assembly is always below the limits for the coupling or belt side drive components, meaning it determines the maximum permissible speed of the mechanical system.

**Compact modules CKK**

**Maximum permissible speed**

$$v_{\text{mech}} = v_{\text{max}}$$

**Maximum permissible rotary speed**

For motor attachment via flange and coupling

$$n_{\text{mech}} = \frac{v_{\text{mech}} \cdot 1\,000 \cdot 60}{P}$$

For motor attachment via belt side drive

$$n_{\text{mech}} = \frac{v_{\text{mech}} \cdot i \cdot 1\,000 \cdot 60}{P}$$

**Compact modules CKR**

**Maximum permissible speed**

For direct motor attachment (without gear)

$$v_{\text{mech}} = v_{\text{max}}$$

$$v_{\text{mech}} = \frac{n_{\text{mech}} \cdot \pi \cdot d_3}{1000 \cdot 60}$$

For motor attachment via gear

$$v_{\text{mech}} = \frac{n_{\text{mech}} \cdot \pi \cdot d_3}{i \cdot 1\,000 \cdot 60}$$

**Maximum permissible rotary speed**

For direct motor attachment (without gear)

$$n_{\text{mech}} = \frac{v_{\text{mech}} \cdot 1\,000 \cdot 60}{\pi \cdot d_3}$$

$$n_{\text{mech}} = n_p$$

For motor attachment via gear

$$n_p = \frac{v_{\text{max}} \cdot 1\,000 \cdot 60}{\pi \cdot d_3}$$

$$n_{\text{mech}} = \text{minimum}(n_p \cdot i; n_{ge})$$

### Maximum permissible drive torque $M_{\text{mech}}$

The lowest (minimum) of all the values for permissible drive torque of all mechanical components contained in the drive chain determines the maximum permissible drive torque of the mechanical system which has to be taken into consideration as the upper limit for the drive when sizing the motor.

#### Compact modules CKK

For motor attachment via flange and coupling

$$M_{\text{mech}} = \text{minimum} (M_{\text{cN}}; M_{\text{p}})$$

For motor attachment via belt side drive

$$M_{\text{mech}} = \text{minimum} (M_{\text{sd}}; \frac{M_{\text{p}}}{i})$$

#### Compact modules CKR

For direct motor attachment (without gear)

$$M_{\text{mech}} = M_{\text{p}}$$

For motor attachment via gear

$$M_{\text{mech}} = \text{minimum} (\frac{M_{\text{ge}}}{i}; \frac{M_{\text{p}}}{i})$$

**⚠ When considering the complete drive chain (mechanical system + motor/controller), the maximum torque of the motor can lie below the upper limit for the mechanical system ( $M_{\text{mech}}$ ) and thus limit the maximum permissible drive torque of the overall drive chain.**

**If the maximum torque of the motor lies above the upper limit for the mechanical system ( $M_{\text{mech}}$ ), the maximum motor torque must be limited to the permissible value for the mechanical system.**

### General motor preselection

The motor can be generally preselected using the following conditions.

#### Condition 1:

The rotary speed of the motor must be greater than or equal to the rotary speed required for the mechanical system (but not exceeding the maximum permissible limit value).

$$n_{\text{max}} \geq n_{\text{mech}}$$

**Condition 2:**

Consideration of the ratio of mass moments of inertia of the mechanical system and the motor. The ratio of the mass moments of inertia serves as an indicator for the control performance of a motor-controller combination.

The mass moment of inertia of the motor is directly related to the motor size.

Ratio of mass moments of inertia.

For preselection, experience has shown that the following ratios will result in high control performance. These are not rigid limits, but values exceeding them will require closer consideration of the specific application.

Application area	V
Handling	≤ 6.0
Machining	≤ 1.5

$$V = \frac{J_{ex}}{J_m + J_{br}}$$

**Condition 3:**

Estimation of the ratio of the static load moment to the continuous torque of the motor. The torque ratio must be less than or equal to an empirical value of 0.6. This condition roughly factors in the missing dynamic characteristics of an exact motion profile with the required motor torques.

Torque ratio

$$\frac{M_{stat}}{M_0} \leq 0.6$$

Static load moment

$$M_{stat} = M_R + M_g$$

**Compact modules CKK**

Weight moment

For vertical installation position only!

For motor attachment via flange and coupling:  $i = 1$

$$M_g = \frac{P \cdot (m_{ex} + m_{ca}) \cdot g}{2\,000 \cdot \pi \cdot i}$$

**Compact modules CKR**

Weight moment For vertical installation position only!

$$M_g = \frac{d_3 \cdot (m_{ex} + m_{ca}) \cdot g}{2\,000 \cdot i}$$

In the chapter titled ➡ "Configuration and ordering", users can put together standard configurations, including motor attachment, gears and motor, for the various linear motion system sizes by selecting the appropriate options.

By checking the above conditions, it is possible to see whether a standard motor selected in a particular configuration will generally be of a suitable size for the specific application.

**Precise drive sizing**

Preselecting the motor according to this rough guide is no substitute for the required precise design calculations for the drive, taking all moments/torques and rotary speed levels into account. For precise calculation of the electric drive, including consideration of the specific motion profile, please refer to the performance data in the catalog "Rexroth drive technology". When sizing the drive, the maximum permitted values for linear speed, drive torque and acceleration must not be exceeded, in order to avoid damaging the mechanical system.

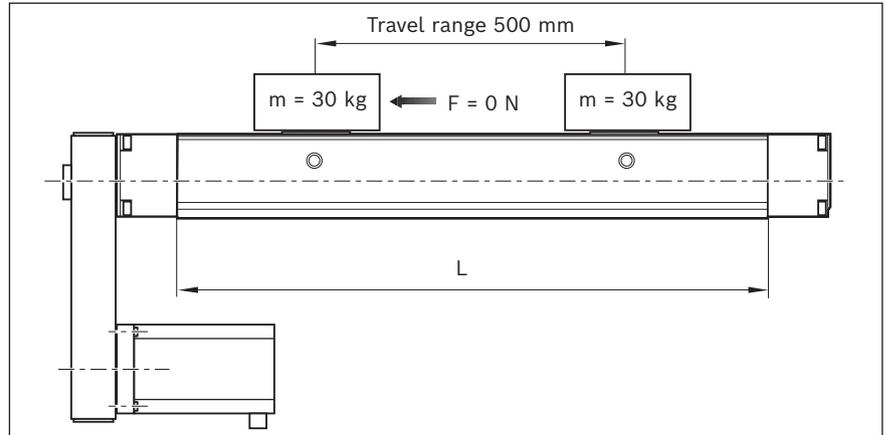

### Calculation example CKK

#### Given data

In a handling task, a mass of 30 kg is to be moved horizontally by 500 mm at a travel speed of 0.5 m/s. The following was selected based on the technical data and the installation space:

#### Compact module CKK-110

- ▶ Carriage with connection plate  
 $L_{ca} = 155 \text{ mm}$
- ▶ With cover strip
- ▶ Motor attachment via belt side drive,  
 $i = 1.5$
- ▶ With motor MS2N04-B0BTN with brake

#### Estimation of length L

(For an initial estimate, the greatest possible lead and length are used for the calculation since the permissible speed can decrease as length increases.)

	$L = s_{eff} + 2 \cdot s_e + L_{ca} + L_{ad}$
Excess travel:	$s_e = 2 \cdot P = 2 \cdot 16 = 32 \text{ mm}$
Max. travel range:	$s_{max} = s_{eff} + 2 \cdot s_e$
	$= 500 + 2 \cdot 32 = 564 \text{ mm}$
Length:	$L = 564 + 155 + 20 = 739 \text{ mm}$

#### Selection of the ball screw assembly

(Better to choose the lowest lead as this is favorable in terms of resolution, braking distance, length.)

Permissible ball screw assemblies according to "Permissible speed" graph with given  $v = 0.5 \text{ m/s}$  and  $L = 739 \text{ mm}$ :

BASA 16 x 10 and BASA 16 x 16

Selected ball screw assembly (lower lead):

BASA 16 x 10

Maximum permissible speed for BASA 16 x 10 from graph:

$$v_{max} = 0.77 \text{ m/s}$$

#### Calculation of length L

(for selected ball screw assembly)

Excess travel:	$s_e = 2 \cdot P = 2 \cdot 10 = 20 \text{ mm}$
Max. travel range:	$s_{max} = s_{eff} + 2 \cdot s_e$
	$= 500 + 2 \cdot 20 = 540 \text{ mm}$
Length:	$L = 540 + 155 + 20 = 715 \text{ mm}$

#### Friction moment $M_R$

(motor attachment via belt side drive)

	$M_R = M_{Rsd} + \frac{M_{Rs}}{i}$
Compact module:	$M_{Rs} = 0.43 \text{ Nm}$
Belt side drive:	$M_{Rsd} = 0.40 \text{ Nm} (i = 1.5)$
Friction torque:	$M_R = 0.40 + \frac{0.43}{1.5} = 0.69 \text{ Nm}$

**Mass moment of inertia  $J_{ex}$**

(motor attachment via belt side drive)

$$\begin{aligned}
 J_{ex} &= J_{sd} + \frac{(J_s + J_t)}{i^2} \\
 \text{Belt side drive: } J_{sd} &= 82 \cdot 10^{-6} \text{ kgm}^2 \\
 \text{Compact module: } J_s &= (k_{J \text{ fix}} + k_{J \text{ var}} \cdot L) \cdot 10^{-6} \\
 &= (8.432 + 0.031 \cdot 715) \cdot 10^{-6} \\
 &= 30.597 \cdot 10^{-6} \text{ kgm}^2 \\
 \text{External load: } J_t &= m_{ex} \cdot k_{J \text{ m}} \cdot 10^{-6} \\
 &= 30 \cdot 2.533 \cdot 10^{-6} \\
 &= 75.99 \cdot 10^{-6} \text{ kgm}^2 \\
 \text{Mass moment of inertia: } J_{ex} &= 82 \cdot 10^{-6} + \frac{(30.597 \cdot 10^{-6} + 75.99 \cdot 10^{-6})}{1.5^2} \\
 &= 129.372 \cdot 10^{-6} \text{ kgm}^2
 \end{aligned}$$

**Maximum permissible rotary speed  $n_{mech}$**

(motor attachment via belt side drive)  
 mechanical system limit

$$\begin{aligned}
 n_{mech} &= \frac{(0.77 \cdot 1.5 \cdot 1\,000 \cdot 60)}{10} \\
 \text{Max. permissible speed: } v_{mech} &= v_{max} = 0.77 \text{ m/s} \\
 \text{Max. permissible rotary speed: } n_{mech} &= \frac{(v_{mech} \cdot i \cdot 1,000 \cdot 60)}{P} \\
 &= 6\,930 \text{ min}^{-1}
 \end{aligned}$$

**Maximum rotary speed of the application  $n_{mech}$**

(motor attachment via belt side drive)  
 application limit

$$\begin{aligned}
 \text{Speed: } v_{mech} &= 0.5 \text{ m/s} \\
 \text{Rotary speed: } n_{mech} &= \frac{0.5 \cdot 1.5 \cdot 1\,000 \cdot 60}{10} \\
 &= 4\,500 \text{ min}^{-1}
 \end{aligned}$$

**Calculation example CKK**

**Maximum permissible**

**drive torque  $M_{\text{mech}}$**

(motor attachment via belt side drive)  
mechanical system limit

$$M_{\text{mech}} = \text{Minimum} \left( M_{\text{sd}}; \frac{M_{\text{p}}}{i} \right)$$

Belt side drive:  $M_{\text{sd}} = 5.11 \text{ Nm}$  (gear ratio  $i = 1.5$  for MS2N04-B0BTN)

Compact module:  $M_{\text{p}} = 13.51 \text{ Nm}$

Drive torque:  $M_{\text{mech}} = \text{Minimum} \left( 5.11; \frac{13.51}{1.5} \right)$   
 $= \text{Minimum} (5.11; 9.0)$   
 $= 5.11 \text{ Nm}$

**Motor preselection check**

Selected motor:

MS2N04-B0BTN with brake

**Condition 1:**

Rotary speed:  $n_{\text{max}} \geq n_{\text{mech}}$   
 $6,000 \geq 4500$  condition met – motor selection OK

**Condition 2:**

Mass moment of inertia ratio:  $V = \frac{J_{\text{ex}}}{J_{\text{m}} + J_{\text{br}}}$

Motor inertia:  $J_{\text{m}} = 70 \cdot 10^{-6} \text{ kgm}^2$

Brake moment of inertia:  $J_{\text{br}} = 40 \cdot 10^{-6} \text{ kgm}^2$

Moment of inertia ratio:  $V = \frac{129.372 \cdot 10^{-6}}{(70 \cdot 10^{-6} + 40 \cdot 10^{-6})} = 1.18$

Handling condition:  $V \leq 6$   
 $1.18 \leq 6$  condition met  
 – motor selection OK

**Condition 3:**

Torque ratio:  $\frac{M_{\text{stat}}}{M_0} \leq 0.6$

Static load moment:  $M_{\text{stat}} = M_{\text{R}} + M_{\text{g}}$  (installed horizontally  $M_{\text{g}} = 0$ )  
 $= 0.69 \text{ Nm}$

Continuous motor torque:  $M_0 = 1.75 \text{ Nm}$

Torque ratio:  $\frac{0.69}{1.75} = 0.39$   
 $0.39 \leq 0.6$  condition met  
 – motor selection OK

**All three conditions met ⇒ Selected motor is suitable for the application.**

**Result**

**Compact module CKK-110**

Length:  $L = 715 \text{ mm}$   
 Max. travel range:  $s_{\max} = 540 \text{ mm}$   
 Carriage length:  $L_{\text{ca}} = 155 \text{ mm}$   
 Ball screw assembly: Nominal diameter:  $d_0 = 16 \text{ mm}$   
 Lead:  $P = 10 \text{ mm}$

With cover strip  
 Motor attachment via belt side drive, gear ratio  $i = 1.5$   
 Motor preselection: MS2N04-B0BTN with brake

For precise sizing of the electric drive, the motor-controller combination must always be considered, as the performance data (e.g. maximum useful speed and maximum torque) will depend on the controller used.

When doing this, the following data must be considered:

Friction torque:  $M_R = 0.69 \text{ Nm}$   
 Mass moment of inertia:  $J_{\text{ex}} = 129.372 \cdot 10^{-6} \text{ kgm}^2$   
 Speed:  $v_{\text{mech}} = 0.5 \text{ m/s}$  ( $n_{\text{mech}} = 4\,500 \text{ rpm}$ )  
 Drive torque limit:  $M_{\text{mech}} = 5.11 \text{ Nm}$

⇒ The motor torque must be limited to 5.11 Nm on the drive side!

Acceleration limit:  $a_{\max} = 50 \text{ m/s}^2$   
 Limit for speed:  $v_{\max} = 0.77 \text{ m/s}$  ( $n_{\text{mech}} = 6\,930 \text{ rpm}$ )

Besides the preferred type MS2N04-B0BTN, other motors with identical connection dimensions can be adapted while taking care not to exceed the calculated limit values.

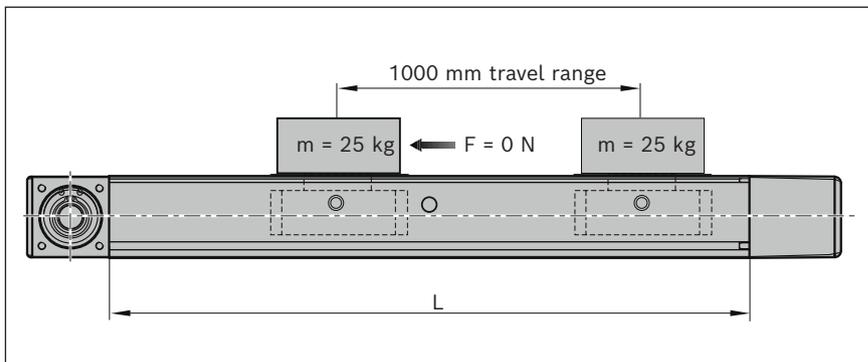

### Calculation example CKR

#### Given data

In a handling task, a mass of 25 kg is to be moved horizontally by 1000 mm at a travel speed of 1.5 m/s. The following was selected based on the technical data and the installation space:

#### compact module CKR-145

- ▶ Carriage length = 190 mm
- ▶ With connection plate
- ▶ Motor attachment via planetary gear,  $i = 5$
- ▶ With motor MS2N04-D0BQN without brake

#### Calculation of length L

(In most cases, 2x feed constant is sufficient as general guideline value for excess travel. The excess travel must be greater than the emergency stop stopping distance, which is calculated for exact sizing of the electrical drive.)

$$\begin{aligned}
 L &= s_{\max} + L_{ca} + L_{ad} \\
 \text{Feed constant: } u &= \frac{u(i=1)}{i} \\
 &= \frac{165}{5} = 33 \text{ mm} \\
 \text{Excess travel: } s_e &= 2 \cdot u = 2 \cdot 33 = 66 \text{ mm} \\
 \text{Max. travel range: } s_{\max} &= s_{\text{eff}} + 2 \cdot s_e \\
 &= 1\,000 + 2 \cdot 66 = 1132 \text{ mm} \\
 \text{Length: } L &= 1\,132 + 190 + 75 = 1397 \text{ mm}
 \end{aligned}$$

#### Friction torque $M_R$

$$\begin{aligned}
 M_R &= M_{Rge} + \frac{M_{Rs}}{i} \\
 \text{Compact module: } M_{Rs} &= 2.04 \text{ Nm} \\
 \text{Gear: } M_{Rge} &= 0.17 \text{ Nm} \\
 \text{Friction torque: } M_R &= 0.17 + \frac{2.04}{5} = 0.58 \text{ Nm}
 \end{aligned}$$

#### Mass moment of inertia $J_{ex}$

$$\begin{aligned}
 J_{ex} &= J_{ge} + \frac{(J_s + J_t)}{i^2} \\
 \text{Gear: } J_{ge} &= 27 \cdot 10^{-6} \\
 \text{Compact module: } J_s &= (k_{J \text{ fix}} + k_{J \text{ var}} \cdot L) \cdot 10^{-6} \\
 &= (2\,276.71 + 0.3172 \cdot 1397) \cdot 10^{-6} \\
 &= 2\,719.838 \cdot 10^{-6} \text{ kgm}^2 \\
 \text{External load: } J_t &= m_{ex} \cdot k_{Jm} \cdot 10^{-6} \\
 &= 25 \cdot 689.59 \cdot 10^{-6} \\
 &= 17\,239.75 \cdot 10^{-6} \text{ kgm}^2 \\
 \text{Mass moment of inertia: } J_{ex} &= 27 \cdot 10^{-6} + \frac{(2\,719.838 \cdot 10^{-6} + 17\,239.75 \cdot 10^{-6})}{5^2} \\
 &= 825.384 \cdot 10^{-6} \text{ kgm}^2
 \end{aligned}$$

**Maximum permissible rotary speed  $n_{\text{mech}}$**

(Motor attachment via gear reducer,  
 without considering the motor)

Limit for mechanical system

$$n_{\text{mech}} = \text{Minimum} (n_p \cdot i ; n_{\text{ge}})$$

Compact module:  $n_p = \frac{(v_{\text{max}} \cdot 1\,000 \cdot 60)}{\pi \cdot d_3}$

$$= \frac{(5 \cdot 1\,000 \cdot 60)}{\pi \cdot 52.52}$$

$$= 1\,818 \text{ rpm}$$

Gear:  $n_{\text{ge}} = 8\,000 \text{ rpm}$

Max. permissible rotary speed:  $n_{\text{mech}} = \text{Minimum} (1\,818 \cdot 5 ; 8\,000)$

$$= \text{Minimum} (9\,090 ; 8\,000)$$

$$= 8\,000 \text{ rpm}$$

**Maximum permissible speed  $v_{\text{mech}}$**

(Motor attachment via gear reducer,  
 without considering the motor)

Limit for mechanical system

$$v_{\text{mech}} = \frac{(n_{\text{mech}} \cdot \pi \cdot d_3)}{i \cdot 1\,000 \cdot 60}$$

Max. permissible speed:  $v_{\text{mech}} = \frac{(8\,000 \cdot \pi \cdot 52.52)}{5 \cdot 1\,000 \cdot 60}$

$$= 4.4 \text{ m/s}$$

**Maximum permitted rotary speed of the application  $n_{\text{mech}}$**

(Motor attachment via gear reducer,  
 without considering the motor)

Application tolerance

Speed:  $v_{\text{mech}} = 1.5 \text{ m/s}$

Rotary speed:  $n_{\text{mech}} = \frac{(1.5 \cdot 5 \cdot 1\,000 \cdot 60)}{\pi \cdot 52.52}$

$$= 2\,727 \text{ rpm}$$

**Maximum permissible drive torque  $M_{\text{mech}}$**

(Motor attachment via gear reducer,  
 without considering the motor)

Limit for mechanical system

$$M_{\text{mech}} = \text{Minimum} \left( \frac{M_{\text{ge}}}{i} ; \frac{M_p}{i} \right)$$

Compact module:  $M_p = 32.5 \text{ Nm}$

Gear:  $M_{\text{ge}} = 40 \text{ Nm}$

Drive torque:  $M_{\text{mech}} = \text{Minimum} \left( \frac{40}{5} ; \frac{32.5}{5} \right)$

$$= \text{Minimum} (8.0 ; 6.5)$$

$$= 6.5 \text{ Nm}$$

### Calculation example CKR

#### Motor preselection check

Selected motor:  
MS2N04-D0BQN without brake

#### Condition 1:

Rotary speed:  $n_{\max} \geq n_{\text{mech}}$   
 $6,000 \geq 2727$  condition met – motor selection OK

#### Condition 2:

Mass moment of inertia ratio:  $V = \frac{J_{\text{ex}}}{J_m + J_{\text{br}}}$   
Motor inertia:  $J_m = 160 \cdot 10^{-6} \text{ kgm}^2$   
Brake moment of inertia:  $J_{\text{br}} = 0 \text{ kgm}^2$  (without brake)  
Moment of inertia ratio:  $V = \frac{825.384 \cdot 10^{-6}}{160 \cdot 10^{-6}}$   
 $= 5.16$   
Handling condition:  $V \leq 6$   
 $5.16 \leq 6$  condition met  
– motor selection OK

#### Condition 3:

Torque ratio:  $\frac{M_{\text{stat}}}{M_0} \leq 0.6$   
Static load moment:  $M_{\text{stat}} = M_R + M_g$  (installed horizontally  $M_g = 0$ )  
 $\frac{0.58}{3.85} = 0.58 \text{ Nm}$   
Continuous torque  
of the motor:  $M_0 = 3.85 \text{ Nm}$   
Torque ratio:  $= 0.15$   
 $0.15 \leq 0.6$  condition met  
– motor selection OK

**All three conditions met  $\Rightarrow$  selected motor is suitable for the application.**

**Result**

**compact module CKR-145**

Length  $L = 1\,397\text{ mm}$   
 Max. travel range  $s_{\max} = 1\,132\text{ mm}$   
 Carriage length  $L_{\text{ca}} = 190\text{ mm}$

Toothed belt drive

With connection plate

Motor attachment via planetary gear, gear ratio  $i = 5$

Motor preselection: MS2N04-D0BQN without brake

For precise sizing of the electric drive, the motor-controller combination must always be considered, as the performance data (for example, maximum useful speed and maximum torque) will depend on the controller used.

When doing this, the following data must be considered.

Friction torque  $M_R = 0.58\text{ Nm}$   
 Mass moment of inertia  $J_{\text{ex}} = 825.384 \cdot 10^{-6}\text{ kgm}^2$   
 Travel speed  $v_{\text{mech}} = 1.5\text{ m/s}$  ( $n_{\text{mech}} = 2\,727\text{ min}^{-1}$ )  
 Drive torque limit  $M_{\text{mech}} = 6.5\text{ Nm}$

➡ The motor torque must be limited to 6.5 Nm on the drive side!

Acceleration limit  $a_{\max} = 50\text{ m/s}^2$   
 Limit for travel speed  $v_{\max} = 3.3\text{ m/s}$  ( $n_{\max} = 6\,000\text{ min}^{-1}$ )

After determining the emergency-stop stopping distance during precise sizing, the selected excess travel must be checked to see whether it is sufficient and adjusted if necessary.

Besides the preferred type MS2N04-D0BQ, other motors with identical connection dimension can be adapted while taking care not to exceed the calculated limits.

$v_{mech}$	Maximum permissible speed of mechanical system	(m/s)
$v_{mgw}$	Average linear speed of the guideway	(m/s)
$V$	Ratio of mass moments of inertia of drive chain and motor	(–)
$z_1$	Application point of the effective force	(mm)

## Ordering example CKK

Ordering data		Explanation
Compact module	CKK-110-NN-1	Compact module with ball screw assembly CKK-110-NN-1
Length L	715	Length = 715 mm
Version	RV01	Belt side drive
Guideway	001	Standard main body
Lubrication <sup>1)</sup>	LSS	Standard lubrication
<b>Drive</b>		
BASA (ball screw assembly $d_0 \times P$ )	002	Nominal diameter = 16 mm, lead = 10 mm
<b>Carriage</b>		
Carriage <sup>2)</sup>	041	Carriage with connection plate, $L_{ca} = 155$ mm
Carriage centerline-to-centerline distance $L_w$	–	Only necessary with carriages with variable center-to-center distance
<b>Motor attachment</b>		
Gear ratio	–	Without gear ratio
Attachment kit <sup>3)</sup>	023	Motor attachment for MS2N04-C0BTN servo motor
<b>Motor</b>		
Motor code	212	MS2N04-B0BTN, 1 cable, with brake
Motor connector position	270	Motor connector position = 270°
<b>Cover</b>		
Cover	002	With cover strip
<b>Switching system (max. 6 switches/sensors selectable)</b>		
Sensor 1	021	REED, changeover contact (NC: C+NC, NO: C+NO)
Sensor 2	022	Hall, PNP normally closed (NC)
Sensor 3	021	REED, changeover contact (NC: C+NC, NO: C+NO)
Cable duct / cable channel	025	Cable duct
Socket-connector	017	Socket-connector
Automation package (Controller, Cable)		➡ Chapter "Automation package"
Documentation	001	Standard report

<sup>1)</sup> Not part of the option key

<sup>2)</sup> For the permissible values see "General technical data"

<sup>3)</sup> The motor geometry code is required for motors according to customer specifications
